### EPA Method 200.8

EPA Method 200.8 provides procedures for determination of dissolved elements in ground waters, surface waters and drinking water by ICP-MS. It may also be used for determination of total recoverable element concentrations in these waters as well as wastewaters, sludges and solid waste samples.

## High purity acids

LGC Standards offers the most frequently used mineral acids for trace analysis: hydrochloric acid, nitric acid, hydrofluoric acid, sulfuric acid, perchloric acid and acetic acid. These are produced by subboiling distillation of very pure starting materials. This purification results in most metallic impurities reduced to (or below) ppb ranges. The acids are delivered in special bottles (long - term leached borosilicate glass or modified HDPE) which ensure minimum contamination of the acid from the material of the bottle.

Important note: Element concentrations are at the point of bottling. Concentrations of some elements may increase due to the storage container.

# Stable isotope labelled standards from CIL

# Stable isotope labelled standards from Cambridge Isotope Laboratories (CIL)

LGC Standards, in partnership with Cambridge Isotope Laboratories, offers a full range of environmental standards designed for use with isotope dilution mass spectrometry (IDMS). Cambridge Isotope Laboratories is the world's premier producer of stable isotope labelled compounds and specialises in the development, production, and marketing of compounds labelled with stable (non-radioactive) isotopes.

LGC Standards provides you with:

- Expert local customer service and technical support
- Assistance in finding the right product to meet your needs
- Regular updates about new products

## Environmental contaminant standards from CIL

LGC Standards is delighted to introduce a fully updated listing of environmental contaminant standards from Cambridge Isotope Laboratories (CIL).

Cambridge Isotope Laboratories, Inc. (CIL) is the world's premier producer of stable isotope labelled compounds and the world leader in the field of isotope separations with an annual production capacity of 120 kilograms of carbon-13 and 250 kilograms of oxygen-18. For more than 20 years, CIL has specialised in the development, production, and marketing of stable (non-radioactive) isotopes and chemical compounds labelled with stable isotopes. In the environmental field they produce a wide range of contaminant standards designed for use with Isotope Dilution Mass Spectrometry (IDMS). Through their ongoing commitment to the manufacture of the highest quality products CIL has earned the respect of the analytical community.

This catalogue lists a comprehensive selection of around 2500 products covering contaminants from dioxins to veterinary medicine residues and from brominated flame-retardants to chemical weapons. Many new products have been developed in response to worldwide customer requests and others are formulated to meet the needs of customers using official or even draft methods, for example in the important area of Persistent Organic pollutants (POPs) covered by the Stockholm Treaty.

It is not possible to list all the compounds in the CIL inventory in this catalogue so if you cannot find the product you need, please contact your local LGC Standards office for further information.

### An introduction to CIL

Cambridge Isotope Laboratories is the world leader in the manufacture and separation of stable isotopes and stable isotope labelled compounds. Their area of expertise is the synthesis of isotopically labelled biochemical and organic compounds with highly enriched isotopes of carbon, hydrogen, nitrogen and oxygen. CIL is committed to providing the highest quality products coupled with unsurpassed service to researchers worldwide. They proudly offer the world's largest inventory of stable isotope labelled compounds. Their unmatched selection has contributed to advancements in environmental analysis, chemistry, biochemistry, physics, biomedical and diagnostic research.

For nearly 30 years, CIL has produced stable isotope labelled standards for the analysis of environmental contaminants using Isotope Dilution Mass Spectrometry (IDMS). The scope of the field has broadened from a small number of highly specialized analyses requiring complex instrumentation, to a widely expanding range of applications. Recently, IDMS has been applied to more routine, low-resolution Mass Spectrometry (MS) analyses of common pollutants, while detection limits using High-Resolution Gas Chromatography/High-Resolution Mass Spectrometry (HRGC/HRMS) continue to be extended to lower and lower concentrations.

CIL's continuous collaboration of nearly 30 years with Cerilliant allows them to focus their efforts on the long term expansion of CIL/Cerilliant products and to continue to improve the quality, versatility and responsiveness of their product offering. For three decades, CIL has produced stable isotope labeled standards for the analysis of environmental contaminants using Isotope Dilution Mass Spectrometry (IDMS). The scope of the field has broadened from a small number of highly specialized analyses requiring complex instrumentation to a widely expanding range of applications. IDMS has become more routinely applied to

Detection limits using High-Resolution Gas Chromatography/High-Resolution Mass Spectrometry (HRGC/HRMS) continue to be extended to lower and lower concentrations, while at the same time expanding dynamic range. LC/MS has become a driving force in CIL's new product development. Many emerging pollutants can only be analyzed by LC/MS, and the use of isotopically labeled internal standards is an invaluable tool to correct for matrix effects, a common problem when using LC/MS in environmental samples.

### Commitment

Their unyielding commitment to drive the expansion of market applications of stable isotopes with innovative product development has enabled CIL to maintain its status as the world leader in their field. CIL takes great pride and responsibility in its role as the preferred supplier of stable isotopes to leading analytical, academic, pharmaceutical, government and industrial researchers worldwide. Their goal is to develop and manufacture stable isotope labelled compounds for a wide range of scientific and biomedical applications. This goal is most evident in the steady introduction of new CIL environmental contaminant standards produced in direct response to customer requests and new analytical methodology. In anticipation of the environmental analytical community's needs CIL consistently develops products before they are required by new methods.

### Knowledge

CIL's only business is the separation and manufacture of stable isotopes and stable isotope labelled compounds. Since 1981, CIL has worked closely with leading scientific groups in the fields of environmental trace analysis as well as metabolism research, molecular biology, protein structure analysis, organic synthesis, clinical and diagnostic research to provide researchers with the products needed to solve complex challenges. Their staff of synthetic and analytical chemists is dedicated to their environmental contaminant standards product line and are experts in their field with extensive years of experience exclusively in the synthesis and analysis of stable isotope labelled compounds.

### Quality

Since the beginning of their collaboration in the early 1980's, CIL and Cerilliant have dedicated their programs to providing the highest quality environmental standards available anywhere in the world. Each standard provided by CIL and Cerilliant passes the most extensive series of tests, checks, and analyses designed to guarantee chemical and isomeric purity, identity, isotope enrichment and absolute concentration. A complete certificate of analysis accompanies every standard produced. Unlabeled "Certified Standards", developed by CIL to meet the strict requirements of our isotope-labeled standards QC validation, are a fast-growing component of our product line, and considered essential by the most demanding laboratories in the world.

Cerilliant's quality system is rigorous, thorough, and incorporates constant improvement. Originally certified in 1997 by BSI to the ISO 9001 standard, Cerilliant has maintained their certification through the years and recently acquired the ISO 9001:2008 standard. In November 2009, Cerilliant received further accreditation under ISO Guide 34 for Reference Material Producers, as well as ISO/IEC 17025 accreditation for Testing and Calibration Laboratories.

### Service

CIL continues to work with leading groups from many countries to help them develop new solutions to challenging analytical problems. While their catalogue is extensive, new products are added to their inventory on a weekly, sometimes daily, basis. If you are interested in a custom formulation, please contact your local LGC Standards office. If you can't find what you need, we will suggest an in-stock alternative, or quote a price for custom formulation.

### Leadership

CIL has worked with the US EPA, the Centers for Disease Control (CDC), Environment Canada, Bromine Science and Environmental Forum (BSEF), Japanese Industrial Standard (JIS), Netherlands Institute for Fisheries Research (RIVO), and many other international environmental agencies to develop the standards needed for ongoing analytical methods. Several examples of these collaborations include US EPA Methods 1613, 1614, 8280, 23, 1653A, 1624/25 and 1668A.

**CIL has consistently made available, often for the first time anywhere, novel isotope labelled standards for the environmental testing community. CIL and Cerilliant were the first to:**

- Produce <sup>13</sup>C standards for all 17 toxic PCDD and PCDF isomers
- Conduct a round-robin to produce consensus values for all 17 toxic PCDD and PCDF isomers (1987)
- Offer PCDD/PCDF PE standards for Soil and Fish
- Develop <sup>13</sup>C PCB standards
- Produce certified standards for unlabelled PCBs
- Produce <sup>13</sup>C PAH standards
- Produce <sup>13</sup>C polybrominated Dioxins and Furans
- Produce <sup>13</sup>C polybromodiphenyl ether standards
- Produce <sup>13</sup>C chlorinated cyclodiene pesticides
- Produce chemical weapons verification standards
- Produce isotopically labelled PAH, PCB, and BDE Metabolites
- Produce isotopically labelled plasticizer metabolites
- Produce isotopically labelled surfactants
- Produce isotopically labelled standards for all compounds in the Stockholm Convention POPs list

**Offer isotope labelled:**

- Melamine and cyanuric acid standards
- Pesticides and pesticide metabolites
- Pharmaceutical and personal care products
- <sup>13</sup>C<sub>6</sub>-Labelled steroids
- Endocrine disruptors
- Alkyl phenols and ethoxylates
- Chlorophenolics

**Offer certified standards for use with:**

- US EPA Method 1613, 8280, 23, and 8290
- US EPA Method 1668 and 1668 Revision A
- US EPA Method 1614
- US EPA Method 1624 and US EPA Method 1653
- US EPA draft Methods 1694, 1698, and 1699
- EN-1948 and EN-1948-4
- JIS Methods K0311 and K0312, and the "Simplified assay of trace PCBs in dielectric oil"
- CARB Method 429

## CIL sponsorships

In support of the scientific community, CIL sponsors over 150 worldwide conferences and technical symposia each year. CIL is proud to be both a participant in and a sponsor of these conferences which provide a forum for researchers all over the world to unite in the interest of advancing their work. CIL has been a major sponsor of the International Symposium on Halogenated Persistent Organic Pollutants (aka "DIOXIN") for 23 years, and has generously supported many other meetings, including:

ASMS	American Society for Mass Spectrometry
ASNS	American Society for Nutrition Symposium
BFR	Brominated Flame Retardant Workshop
CSC	Canadian Society For Chemistry
Dioxin	International Symposium on Halogenated Persistent Organic Pollutants
Enviro	EnviroAnalysis
EANM	European Association of Nuclear Medicine
GRC	Gordon Research Conference
KS	Keystone Symposia – Frontiers of NMR in Biology
ICMRBS	International Conference on Magnetic Resonance in Biological Systems
ISMAR	International Society of Magnetic Resonance – ISMAR Prize
ISPAC	International Society of Polyaromatic Compounds

## Memberships

CIL enjoys being a supporter of several industry organizations that actively contribute to advancements in stable isotope research. Presently, CIL is affiliated with the following associations:

ANZSMS	Australian and New Zealand Society for Mass Spectrometry
AMI	Academy of Molecular Imaging
ABRF	The Association of Biomolecular Resource Facilities
AAAS	American Association for the Advancement of Science
ACS	American Chemical Society
ASMS	American Society for Mass Spectrometry
AUREMN	Associação de Usuários de Ressonância Magnética Nuclear
CNPN	Canadian National Proteomics Network
CRMMA	Chemical Reference Materials Manufacturing Association
EANM	European Association of Nuclear Medicine
GBMSDG	Greater Boston Mass Spec. Discussion Group
HUPO/IAB	Human Proteome Organisation / Industrial Advisory Board
IIS	International Isotope Society
ISNS	Institute for Neonatal Screening
ISSFAL	International Society for the Study of Fatty Acids and Lipids
NGWA	National Groundwater Association
NAOSMM	National Association of Stockroom Managers
SETAC	Society of Environmental Toxicology & Chemistry

### Isotope separation facility

CIL is a world leader in the separation of  $^{13}\text{C}$  and  $^{18}\text{O}$  isotopes. Twice during the past decade CIL has taken a leadership position in the separation of stable isotopes. First CIL constructed the world's largest  $^{13}\text{C}$  separation facility, which has been in continuous operation for over 10 years, and more recently CIL has undertaken the construction of the world's largest  $^{18}\text{O}$  separation facility. CIL's isotope separation facility, located in Xenia Ohio provides customers with a dependable, secure supply of isotope.

#### Carbon-13 Isotope Separation Facility

CIL is recognized as the world leader in the separation of  $^{13}\text{C}$ . In the 1980's CIL took the initiative to construct the world's largest  $^{13}\text{C}$  isotope separation plant in order to provide sufficient supply of  $^{13}\text{C}$  to support new research and diagnostic developments. CIL's  $^{13}\text{C}$  production facility has an annual production capacity of 120 kg of  $^{13}\text{C}$ .

#### Oxygen-18 Isotope Separation Facility

In 2000, CIL responded to the worldwide shortage of  $^{18}\text{O}$  water by embarking on the construction of the world's largest  $^{18}\text{O}$  isotope separation facility. CIL is now the world's leading producer of  $^{18}\text{O}$  water with an annual production capacity of 250 kg. CIL's  $^{18}\text{O}$  water is used in Positron Emission Tomography (PET) and other expenditure studies.

### Product information

There are potential hazards associated with the use of the chemicals that CIL provides. Customers are encouraged to consult standard safety references for the proper use and handling of CIL products. In addition, while every effort was made to ensure that the information in this catalogue is correct, customers are responsible for confirming product information.

**Documentation:** A Certificate of Analysis (COA) and a Material Safety Data Sheet (MSDS) are supplied with every shipment. Additional information may be available upon request.

**Crystalline/neat standards:** Vials contain approximately the stated amount. Stated weights should not be used to prepare quantitative standards. Material should be weighed by customer prior to standard formulation. Small amounts may need to be transferred with the use of solvent; the vial should be weighed before transfer, and after all solvent has been evaporated. During shipment, small but significant amounts of material may shift into the vial cap or ampoule tip. Traceable weighing records, or weights tailored to user-specified targets can be obtained for a reasonable surcharge.

**Solution standards:** All solutions are prepared to be within +/- 2% of stated value, unless otherwise stated on the Certificate of Analysis. Of particular use is uncertainty information, which is calculated uniquely for every formulation. Cumulative uncertainty from all formulation preparation steps such as weighings and dilutions are presented to help analysts determine the accuracy of their own measurements. Uncertainty for mixtures will of necessity have higher uncertainties than those for individual solutions, because extra formulation steps introduce additional uncertainty.

#### Chemical purities:

Chemical purities of unlabelled/native standards are 97-99+% unless otherwise specified.

Chemical purities of labelled standards are 95-99+% unless otherwise specified.

**Isotopic enrichment:** Isotopic enrichments are 99% for Carbon-13, 98% for deuterium and 96% for Chlorine-37, unless otherwise specified.

Isotopic enrichment is the average enrichment for each labeled atom in the molecule. It is not the percentage of the molecules that are completely isotope-labeled. For instance, Dichlorophenol (ring- $^{13}\text{C}_6$ , 99%) is not 99%  $^{13}\text{C}_6$ , and 1%  $^{12}\text{C}_6$ . Each carbon atom position (1,2,3,4,5 & 6) has a 99% chance of being  $^{13}\text{C}$ -labeled, and a 1% chance of being  $^{12}\text{C}$ -labeled. Thus, (99%) or ~94% of the molecules will have a molecular mass 6 AMU higher than native Dichlorophenol, and ~6% will have a molecular mass 5 AMU higher than native Dichlorophenol. Theoretically, only (1%) or ~10-10% will have the molecular mass of  $^{12}\text{C}_6$  Dichlorophenol.

**Solvents used in quantitative solutions:** When virtually all the analytes in CIL's Environmental Contaminant Standard products offerings were persistent halogenated aromatic compounds, solvent selection was relatively straightforward. Although Benzene and Toluene were default solvents, they are now solvents of last resort owing to concerns of carcinogenicity. They are also fairly volatile, which can affect the integrity of the quantitative accuracy of the standard. For many years, virtually all of CIL's standards were prepared in Nonane or Isooctane, solvents which CIL buys in bulk as Spectrophotometric Grade, and then distills even further to make suitable for ultra-trace analysis.

The extra-distilled solvents that CIL uses for standard solutions are available for sale to laboratories that wish to dilute or formulate standards using the cleanest possible solvents.

In recent years, as a larger proportion of standards offered by CIL are more polar, and often analyzed in polar media, many standards are now available in polar solvents such as Acetonitrile, Methanol, and even Water. Many of these standards are unstable in certain solvents, so CIL carefully chooses solvents that are suitable in terms of solubility and stability. Even so, some of these classes of compounds are only stable for a few months to a couple years, and special care should be taken to ensure that they are stored properly. In some cases, co-solvents are required for solubility.

**Storage:** When standards are frozen, it is a good idea to gently warm them to room temperature and vortex before opening. Sonication can cause decomposition of certain compounds, so it should only be used very carefully.

Several compounds that CIL offers have extremely short stability in virtually all solvents. For these products CIL offers neat quantitative standards that can be reconstituted and used as needed. These standards are made by adding a volume of accurately formulated standard solution in the ampoule, and drying off all solvent. The remaining neat product is much more stable than the solution, and can be stored for longer periods.

The biggest threats to the integrity of unopened standards are heat, light (especially UV), Oxygen, and pH. These threats also affect opened standards, or standards that have been combined with other compounds, but opened standards are also subject to contamination from glassware/containers, pipettes, and ambient air. The integrity of opened standards is also threatened by solvent evaporation, solubility (when frozen), and decomposition when mixed with other solvents.

It is always good practice to recertify standards when they have been in storage; the safest laboratory practice is to recertify standards each time they are used.

### Statement on shelf life testing and expiration dates of CIL products

Cambridge Isotope Laboratories assigns a retest date and/or expiration date for all manufactured products. The assignments procedure is based upon the known stability characteristics of each product.

- CIL assigns expiration dates for unopened ampoules which have been stored according to CIL's storage instruction. Once the ampoule or vial is opened, it is incumbent upon the user's quality system to decide how long a standard can be used. Ideally, the standard is evaluated each time it is used as part of the analytical QA protocols.
- CIL's expiration date becomes secondary once a standard has been combined with other standards, diluted with solvent, or transferred to a new container. The suitability of the standard then becomes completely dependent on the storage conditions (temperature, light, exposure to other analytes and solvents) and the handling of the standard. The user's QA protocols should determine the duration of the standard's use, and the frequency that it is retested.
- Some products are known to be stable indefinitely. For these products, CIL assigns an expiration date of ten years from the date of release from QC. All other products are retested in five years or less, depending on their chemical characteristics. Most CIL products are sold and shipped with at least one year remaining before the retest date, but occasionally that is not possible.
- Compounds known to be less stable are retested sooner than five years from the date of release; some products are retested as often as every three months or prior to sale, if necessary.

## Packaging information

**Liquids:** Scored (breakneck) clear or amber glass ampoules which are flame sealed under nitrogen atmosphere. CIL's state-of-the-art ampouling machine allows us to maintain the highest consistency and quality. Sizes range from 0.1 g to 50 g. Amber glass, screw cap bottles with teflon lined caps and tape seals are also used. Standard sizes range from 5 g to 1 kg.

**Solids:** Amber glass, wide mouth, screw cap jars with teflon lined caps and tape seals. Clear glass conical vials are used for small quantities.

**Quantitative solutions:** While many of CIL's Environmental Contaminant Standards are packaged in vials, most are supplied as quantitative solutions in amber vials to prevent evaporation. Ampoules are stored in cardboard rondos or plastic "clamshells" with outside labels. Follow the storage instructions, and carefully transfer to other packaging or end-use mixtures as appropriate.

### Certified reference standards

The preparation of polychlorinated dibenzo-p-dioxin (PCDD) and dibenzofuran (PCDF) certified solution standards begins with the total synthesis of each isomer from known, well-characterized intermediates. Cerilliant QC protocol specifies that all materials be tested to determine identity (multiple techniques), isomer specificity, and purity (multiple techniques), prior to acceptance as a raw material.

With few exceptions, our specifications require a chemical purity of >98% for native material and chemical purity of >97% for 13C material.

Preparation of CIL /Cerilliant certified solution standards is tightly controlled using a validated process to ensure accuracy and consistency. Our gravimetric approach (both analyte and solvent are added by weight) is performed using high precision 5-place, micro and ultra-micro analytical balances and governed by exacting procedures to ensure minimal uncertainty. Balances are fully qualified in their installed state, are calibrated semi-annually with weekly and pre-use verifications performed – all using NIST traceable weights. Various controls are employed during the dispensing process to ensure no evaporation, degradation, or contamination occurs and to ensure homogeneity and consistency of fill volume from ampoule to ampoule.

Fully certified standards are then put through rigorous QC testing to verify concentration accuracy, consistency with previous lots (when available), and comparison to the corresponding native or 13C analog. Finally, homogeneity is assured through testing of samples pulled during the dispensing process using a random stratified sampling plan. The analytical results are detailed in a comprehensive Certificate of Analysis (COA) containing complete traceability documentation, which is supplied with each product at no additional charge.

An international round robin study composed of independent government, commercial, and research laboratories analyzed all 17 CIL /Cerilliant 2,3,7,8-containing polychlorinated dibenzo-p-dioxin (PCDD) and dibenzofuran (PCDF) individual solution standards in August 1987. The objective of the study was to determine the accuracy of CIL /Cerilliant solution reference standards. The consensus average values for each of these solutions agreed closely with CIL /Cerilliant reported values – in fact, 15 out of the 17 were within 4%.

### Unlabelled chlorodioxin/furan standards for elution profiling

CIL introduces the first commercially available set of all 136 Tetra-Octa chlorinated dioxin and furan congeners. These qualitative standards are available as ~25ng/mL solutions in Nonane and are used primarily for elution profiling and peak identification. Homolog group kits are available, as is a suite of all 136 congeners.

### ISO Accreditation

Adding to their list of firsts in the field of dioxin and furan reference standards, CIL is pleased to announce the availability of the first dioxin and furan standards manufactured under ISO/ IEC 17025 and ISO Guide 34 accreditation.

Cerilliant Corporation, CIL's longtime collaborator for dioxin and furan standards, has received accreditation under ISO Guide 34 for Reference Material Producers, as well as ISO/IEC 17025 for Testing and Calibration Laboratories. These two new accreditations provide a powerful boost to their already impressive quality credentials, including ISO-9001:2008.

## Comprehensive unlabelled chlorodioxin/chlorofuran standards for elution profiling

For convenience, CIL has bundled these standards by level of chlorination. Kits are available for tetra through hexa dioxins and tetra through hepta furans. a comprehensive kit containing all available standards is also available.

## Dioxin & furan method standards, standard mixtures & reference materials

### U.S. EPA, JIS, and CEN dioxin and furan method standard mixtures

In 1990 CIL /Cerilliant (formerly Radian) introduced the first “ready-to-use” standard mixtures for U.S. EPA Method 1613 “High Resolution GC/MS Method for the Determination of Tetra-Octa Chlorinated Dioxins and Furans”. With the effectiveness and popularity of these pre-formulated mixtures, CIL /Cerilliant next developed “ready-to-use” standards for EPA Method 8280 for low resolution GC/MS analysis of dioxins and furans. Today CIL /Cerilliant offer convenient dioxin and furan standard mixtures for EPA Methods 23 and 8290, as well as the Japanese Industrial Standards methods JIS-K0311 and K0312, and the European Community method EN-1948.

### NEW Reference Materials

In 2006 CIL completed an international interlaboratory study for the determination of many environmental pollutants in our three fish reference materials, as well as two RMs for soil and sediment. In 2007 CIL conducted another interlab study, this time evaluating dioxins, furans, and PCBs in a new Fly Ash Reference Material. In 2010, CIL has launched yet another interlaboratory study to develop consensus values for priority pollutants in Cod Liver Oil Reference Material. Results for the CLO RM will be available in autumn of 2010.

### Dioxin and Furan plus PCB Standard Mixtures

CIL /Cerilliant have developed several mixtures which include the 2,3,7,8-containing dioxin and furan congeners, as well as the “toxic” PCB congeners. With full calibration series and matching spiking solutions, analysts can test these two commonly combined groups without having to manipulate several different standard sets.

### Non-2,3,7,8-Containing Standard Mixtures

With the development of several new <sup>13</sup>C-labelled “non-2,3,7,8” furan standards, CIL /Cerilliant now offer standard mixtures which contain the traditional 17 “2,3,7,8-containing” standards, as well as the new <sup>13</sup>C-labelled “non-2,3,7,8-containing” congeners. These standard mixtures allow researchers to use all 17 <sup>13</sup>C-labelled 2,3,7,8-containing standards as Internal Standards, while utilizing the labelled “non-2,3,7,8-containing” congeners as Recovery/Injection or Cleanup standards.

### NEW Two Column Dioxin and Furan Standard Mixtures

Two Column dioxin and furan standard mixtures are combination mixtures used to confirm dioxins and furans and PCBs using only two columns. These standards combine the benefits of both the “Dioxin and Furan plus PCB” mixtures and the “Non-2,3,7,8-Containing” mixtures.

### Expanded PBDD/F Standards and Standard Mixtures

Polybrominated dioxins and furans (PBDD/F) can be found at trace levels in technical brominated flame retardant products, and may also be formed from combustion of these materials in the presence of organic compounds. The biological effects of PBDD/Fs are similar to those of their chlorinated analogs which have been regulated for many years. CIL now offers a comprehensive set of labelled and unlabelled standards for PBDD/F analysis, including new calibration series and corresponding spiking solutions containing tetra-octabromo congeners.

### ISO Accreditation

Adding to our list of firsts in the field of dioxin and furan reference standards, CIL is pleased to announce the availability of the first dioxin and furan standards manufactured under ISO/ IEC 17025 and ISO Guide 34 accreditation.

Cerilliant Corporation, CIL’s longtime collaborator for dioxin and furan standards, has received accreditation under ISO Guide 34 for Reference Material Producers, as well as ISO/IEC 17025 for Testing and Calibration Laboratories. These two new accreditations provide a powerful boost to their already impressive quality credentials, including ISO-9001:2008.

	These standard solutions have been specifically prepared for the Low-Resolution GC/MS determination of tetra-octa chlorinated dioxins and furans. Use of these carefully prepared and verified solutions avoids any possible error in dilution/cocktail preparation.

### Performance evaluation standards

#### Fish tissue, soil, and sediment reference materials

In May of 2003 an announcement was sent to Environmental laboratories around the world for a new interlaboratory study conducted by CIL and Cerilliant. The purpose of this study was to characterize dioxin, PCB, pesticide, and other organic contaminant levels in soil, sediment, and fish tissue reference materials.

The objectives of this interlaboratory study were to quantitate the levels of a wide variety of environmental contaminants in two new matrices: a sample taken from river sediment in an area known to have PCB contamination and a soil sample taken from a location where no known contamination had occurred. Additionally, the three Fish Performance Evaluation samples were re-evaluated with new consensus values added to the existing consensus values. The existing analyte list has been expanded to include additional dioxins, furans, and PCBs. Additionally, other analyte groups such as Brominated Flame Retardants, Polyaromatic Hydrocarbons, Pesticides, and other Priority Pollutants have had consensus values obtained.

## Fly ash reference material

In 2007, Cambridge Isotope Laboratories performed an international interlaboratory study on Fly Ash Reference Material purchased from Consorzio INCA in Italy. The ash comes from the filter of a municipal waste incinerator in northern Italy, and has been analyzed and given consensus values for numerous dioxin, furan, and PCB congeners. This sample is meant to be used to evaluate the performance of an analytical laboratory for the analytes given.

	<sup>1</sup> Assigned value as determined by Manna Associates in the UK using Cofino analysis of raw interlaboratory study data.				
	<sup>2</sup> Reference value is the Assigned Value plus or minus two standard deviations. Negative numbers resulting from two standard deviations being greater than the assigned value have no significance.				
	<sup>3</sup> Number of laboratories providing results for this analyte.				
	<sup>4</sup> All numbers in parentheses refer to the IUPAC designation for the compound.				

## Cod liver oil reference materials

In 2010, Cambridge Isotope Laboratories organized an international interlaboratory study on Cod Liver Oil Reference Materials purchased from TestAmerica Laboratories in TN, USA. Commercially available Cod Liver Oil was spiked with known amounts of Dioxins, Furans, and PCBs for the Fortified Cod Liver Oil reference material. A separate standard with no spike was also prepared as a blank. These samples are meant to be used to evaluate the performance of an analytical laboratory for the analytes given.

## PCB standards and standard mixtures

### Unlabelled "Certified" PCB Standards

While CIL's primary business is isotopically labelled standards, it is important to remember that the accuracy and precision of a quantitative analysis is dependent upon the accuracy and precision of the unlabelled (native) standards. In the past, CIL utilized commercially available native standards from multiple vendors for the confirmation of our isotopically labelled standards. It was discovered, however, that there can be substantial variability among the commercial native standards. Thus CIL initiated the "Certified" PCB standards program. CIL prepares native "Certified" standards using good laboratory practice (GLP). Individual, native, crystalline PCB isomers (98%+ purity) are weighed in triplicate on a microbalance calibrated with NIST traceable Class S weights, and formulated to specific concentration. Triplicate analyses of each of the three solutions in isooctane are carried out using GC/MS. In order to establish statistical control, the relative standard deviation (RSD) of each solution must be less than 5%, and the RSD for the entire set of analyses for all three standards must be <5%. When these parameters have been met, the solutions are combined and the resulting solution analyzed again in triplicate by three chemists. If the RSD of these analyses is also <5%, the final product is the "Certified" PCB standard. These 100 µg/mL solutions are highly accurate native standards for quantitation of PCBs. These standards are used in all CIL calibration series and native standard mixtures, and are used to validate all isotope labelled standards from CIL.

### Isotope Labelled PCB Standards

CIL now offers more than 50 individual <sup>13</sup>C-labelled PCB standards to meet the growing needs of researchers utilizing Isotope Dilution MS. All <sup>13</sup>C-labelled PCB standards are quantified against CIL "Certified" unlabelled PCB standards for utmost precision and accuracy.

In addition to the "Dioxin-Like" (DL) congeners designated by the WHO, CIL also offers standards for the "non-Dioxin-Like" or "Marker" PCB congeners found in commercial mixtures, as well as a host of other <sup>13</sup>C-labelled PCB standards used for specialized purposes.

### NEW "High Purity" PCB Standards

For more than 20 years CIL has been a pioneer in developing high quality PCB standards, introducing the first <sup>13</sup>C-labelled PCBs used in the earliest IDMS methods, and more recently developing the first PCB standards formulated under the "Certified Standards" protocol. CIL is once again responding to the needs of the analytical community by providing High Purity PCB standards. As new instrumentation and methodologies drive detection limits lower, the presence of even very low levels of impurities in the labelled standards of other PCB congeners or polychlorinated dibenzo-p-dioxins and dibenzofurans (PCDD/ Fs), become a hindrance to the laboratories minimum detection capabilities. CIL has developed aggressive cleanup procedures, and adopted much tighter quality control specifications for the eight mono-ortho substituted "dioxin-like" PCBs (DL-PCBs). These new specifications include extremely low allowances for <sup>13</sup>C-non-ortho DL-PCBs, native content, other PCB congeners and PCDD/ Fs.

Chemical Identity: Unambiguous identity by GC/MS, <sup>1</sup>H-NMR, <sup>13</sup>C-NMR, and MP determination

Isotopic Enrichment: 99% by GC/MS

Chemical Purity: >98% by GC/MS, GC/ECD, and <sup>1</sup>H-NMR

- Native Content: <0.1% by GC/MS SI
- <sup>13</sup>C-non-ortho DL-PCBs: <0.05% by GC/ECD vs. cal-curve, or HRGC/MS
- 17 (2,3,7,8) Containing PCDD/Fs: <0.05% for each compound by HRGC/MS

Concentration: 40 ± 2 µg/mL by comparison assay vs. native "Certified Standard"

Uncertainty: Conforming to Eurachem/CITAC Guide "Quantifying Uncertainty in Analytical Measurement"

### CEN Method EN-1948-4 PCB Standard Mixtures

In 2006, CIL collaborated with the CEN (European Committee for Standardization) organizing laboratory to develop and define PCB Calibration series and <sup>13</sup>C<sub>12</sub>-labelled spiking solutions to be used with method CEN / TS 1948-4. CIL supplied these standards to the organizing laboratory for use in their Interlaboratory Evaluation Study, and now these same standards are available to you from CIL.

### NEW Comprehensive Native PCB Mixtures

CIL has produced two large mixes of unlabelled PCBs, formulated entirely from CIL's PCB "Certified Standards" individual stock solutions. The Comprehensive Native PCB Mixture is a multipurpose mixture that includes all the WHO Dioxin-Like PCBs that have been assigned TEFs, the predominant congeners, and first- and last-eluting congeners from the Mono through Deca homologue groups. Since some pairs of these compounds coelute on certain columns, the Fully Resolved Native Mono-Deca PCB Mixture was formulated with no coeluting congeners under normal analytical conditions.

### NEW Mixed Bromo/Chloro Biphenyl Standards

CIL now offers a selection of labelled and unlabelled mixed halogenated biphenyl standards and standard mixtures. While very limited research has been done to date, these compounds have been identified in environmental matrices, and warrant further investigation.

### Unlabelled mixed bromo/chloro PCB standards

Mixed bromo/chloro biphenyls are thought to be produced by incinerator combustion and as by-products of BDE production. CIL has started a programme to synthesise this class of compounds to assist researchers in initial studies in this field.

## Unlabelled methyl sulfone PCB standards

Methyl Sulfone derivatives of polychlorinated biphenyls (MeSO<sub>2</sub>-PCBs) are known to be primary metabolic products of PCBs. These are persistent, lipophilic compounds which accumulate in the lung, liver and kidney tissues of mammals exposed to PCBs.

## Brominated flame retardant standards

### Isotope Labelled Brominated Diphenyl Ether (BDE) Standards

Generally used as flame retardants, Brominated Diphenyl Ethers (BDEs) have become chemicals of significant environmental concern. BDEs may be generally considered as persistent and highly lipophilic substances, similar to well known environmental contaminants such as polychlorinated biphenyls (PCBs).

In 1996, Cambridge Isotope Laboratories (CIL) first introduced Chlorinated and Brominated Diphenyl Ether analytical standards. Since then, additional studies in Europe, Canada, Japan, and the United States have significantly increased interest in these products and enabled CIL to extend its flame-retardant offerings.

### U.S. EPA Method 1614 Standard Mixtures

The United States EPA has developed a standardized test method for analysis of Brominated Diphenyl Ethers in multiple matrices by High Resolution GC / MS. CIL worked closely with the EPA and their contracting laboratories to develop standard mixtures specifically for use in Method 1614.

### RoHS BDE Standard Mixtures

The Directive on the Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment (2002 / 95 /EC), commonly referred to as the Restriction of Hazardous Substances Directive (RoHS) was adopted in February 2003 in Europe and took effect in July 2006. This directive restricts the use of several types of hazardous materials in the manufacture of various types of electronic and electrical equipment. CIL worked with laboratories in the European Union to develop standards for analysis of brominated diphenyl ethers under the RoHS guidelines.

### Brominated Flame Retardant Standards and Standard Mixtures

Following regulatory restrictions and voluntary removal of Brominated Diphenyl Ether (BDE) products from many flame retardant applications, new brominated compounds have been developed as replacements for BDEs. As monitoring of these possible environmental pollutants increased, CIL developed several labelled and unlabelled standards to allow accurate analysis of these new-use Brominated Flame Retardant (BFR) compounds. CIL further developed a series of standard mixtures which include a combination of BDEs and other BFRs in comprehensive mixtures.

### Isotope labelled and unlabelled BDE Metabolites

Researchers have suggested that BDE body burdens are not completely represented by measurements of BDEs in tissue or milk.

Analytical data indicates that the liver hydrolyzes BDEs in its attempts to expel them. BDE toxicity is still being established, but there is a likelihood that BDE metabolites have similar or greater toxicity than the parent BDEs. CIL has been producing both unlabelled and  $^{13}\text{C}_{12}$  Methoxy- and Hydroxy-BDEs. These items represent some of the BDE metabolites available from CIL; please contact LGC Standards for more information on these compounds.

## RoHS standards

From 1st July 2006 the use of Pb, Cd, Hg, Cr(VI) and certain polybrominated flame retardants in electric and electronic devices will be banned unless no technical substitute exists. This is a requirement of the Directive 2002/95/EC on the "Reduction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS) and currently limit values of 1 g/kg (0.1 %) are being discussed.

## Substituted benzothiophenes

Substituted dibenzothiophenes, sulfur analogues of the chlorinated dibenzofurans, are of interest to analysts due to their remarkable similarities to the chlorinated dioxin class of compounds. A very high mass resolution is necessary to distinguish a chlorinated dibenzothiophene from a chlorinated dioxin. This fact, coupled with the lack of commercially available pure isomers of these sulfur-containing compounds, has led to some speculation that in certain cases, compounds being quantitated as dioxins were, in reality, dibenzothiophenes.

## Priority pollutant standard mixtures

### Chlorobenzene and Chlorophenol Standard Mixtures

Owing to the sheer volume of use in commercial products, Halogenated Benzenes and Phenols remain among the largest contributors to environmental contamination. The standards listed here are in routine use in many laboratories around the world.

#### U.S. EPA Method 1653a

U.S EPA method 1653A is used for the determination of Pollutants in Pulp and Paper industry wastewater. This revision was promulgated in 1997, superseding the earlier method 1653. While still used primarily for the determination of Chlorophenolic compounds, Revision A incorporates several changes to the analytical procedure, including the use of specially formulated standard mixtures applicable to this revision.

#### U.S. EPA CIP DMC Standard Mixtures

EPA's Contract Laboratory Program (CLP) has developed methods for the analysis of volatile and semi-volatile compounds which utilize isotopically labelled internal standards. These Deuterated Monitoring Compounds (DMCs) have been added to strengthen the analysis by providing sample-by-sample internal standard addition. CIL's CLP DMC standard mixtures are designed to match requirements of the OLC and SOM test methods.

#### U.S. EPA Method 1624/1625

CIL maintains a full suite of standards used for the analysis of volatile and semi-volatile organic compounds by US EPA Method 1624/1625.

## Priority pollutants, endocrine disruptor and chemical contaminant standards

### Pharmaceutical and Personal Care Product (PPCP) Standards

Concern about environmental and human exposure to Pharmaceuticals and Personal Care Products (PPCPs) has grown significantly.

This classification encompasses a broad range of chemicals, ranging from antibiotics to hormones to pesticides. One common theme among these groups is the need for high-quality isotopically labelled standards to strengthen the analysis of PPCPs in difficult matrices such as sewage sludge and wastewater. CIL, with guidance from leading laboratories around the world, has been working diligently to produce representative standards for the analysis of PPCPs.

### Food and Drinking Water analysis Standards

Increased attention to possible contamination of food and water has caused analysts to broaden the scope of trace food and water testing by Isotope Dilution Mass Spectrometry. Of particular interest are veterinary antibiotics used to improve the health of feed animals, ranging from shrimp to poultry to cattle. Human antibiotics, pharmaceuticals, and hormones that are not removed during wastewater treatment are also of interest, as is the routine analysis of POPs, pesticides, and other industrial contaminants that have entered the food and water supply.

### Phthalate and Phthalate Metabolite Standards

Phthalates continue to be a growing environmental concern, especially as more is learned about the effect of continued exposure on the environment and the human body. Phthalate diesters are ubiquitous in the laboratory environment, so many analysts are now examining phthalate monoesters and metabolites of phthalate monoesters to reduce background interferences.

Adipate esters are also anticipated to be of interest to exposure analysts; please inquire if you are interested in additional adipate standards.

### Perfluorinated Compound (PFC) Standards

From stain-resistant textiles to non-stick surface coatings and much more, Poly- and Perfluorinated compounds (PFCs) are nearly ubiquitous chemicals in the environment. CIL offers several new labelled and unlabelled Perfluorinated Carboxylic Acid standards (PFCAs) in this catalog. CIL will be continuously adding to our offerings, so we recommend visiting our website for product updates in this rapidly growing field

### Nitrosamine Standards

Nitrosamine compounds are contaminants that may be found in food and tobacco products, and some have been classified as carcinogenic. While efforts have been made to reduce the levels of nitrosamines in commercial products, the need to monitor trace levels of this pollutant has prompted CIL to expand our offerings of labelled and unlabelled Nitrosamine standards.

### Endocrine Disrupting Compounds and Xenoestrogen Standards

CIL is committed to supporting the analysis of Endocrine Disrupting Compounds (EDCs) using Isotope Dilution Mass Spectrometry. If you require an EDC not listed, please contact us to discuss preparation.

### Halogenated and Substituted Benzene and Phenol Standards

Many industrial and consumer products are composed of chemicals that contain halogenated or substituted benzene or phenol functional groups. Resistant to decomposition and metabolism, these chemicals may persist even after the parent molecule has undergone partial decomposition, or they may exist as a product or an industrial byproduct. The increased use of brominated compounds is expected to lead to more brominated benzenes and phenols in the environment, and the continued presence of chlorinated compounds ensures that chlorinated benzenes and phenols will be found in the environment for years to come.

### Phthalate & phthalate metabolite standards

Phthalates are emerging as a growing environmental concern, especially as more is learned about the effect of continued exposure on the environment and the human body. Phthalate diesters are ubiquitous in the laboratory environment, so many analysts are now examining phthalate monoesters and metabolites of phthalate monoesters to reduce background interferences. Adipate esters are also anticipated to be of interest to exposure analysts and additional adipate standards are expected to be made available.

### Halogenated and substituted benzene and phenol standards

Many industrial and consumer products are composed of chemicals that contain halogenated or substituted benzene, or phenol functional groups. Resistant to decomposition and metabolism, these chemicals may persist even after the parent molecule has undergone partial decomposition, or they may exist as a product or industrial byproduct. The increased use of brominated compounds is expected to lead to more brominated benzenes and phenols in the environment, and the continued presence of chlorinated compounds ensures that chlorinated benzenes and phenols will be found in the environment for years to come.

## Pesticide and chemical weapon standards

### Pesticide Standards

CIL continues to add to our already extensive inventory of isotopically labeled standards for pesticide and pesticide metabolite analysis. As a result of this development over the past few years, we can now present our standards by category, including: Organochlorine, Organophosphorous, Carbamate, Triazine, or Pyrethroid pesticide standards. You can still find our complete listing as well if you wish to scan through the comprehensive array of standards.

### Chlorinated Cyclodiene Pesticide Standards

Chlorinated Cyclodiene Pesticides account for seven of the compounds governed by the Stockholm Convention. While production and use of these compounds is stringently regulated if not banned outright, their widespread use for decades and persistence in the environment ensures their presence in the environment and biota for years to come. CIL offers a comprehensive selection of the individual standards, as well as a growing list of convenient mixes.

### Organochlorine Pesticide Standards

Organochlorinated Pesticides, like Chlorinated Cyclodiene Pesticides, are heavily represented in the list of compounds governed by the Stockholm Convention. Also like Chlorinated Cyclodiene Pesticides, their widespread use for decades and persistence in the environment ensures their presence in the environment and biota for years to come. Organophosphate (OP), Pyrethroid and Carbamate Pesticides As man's quest for less toxic (to larger species) and less environmentally persistent pesticides expands, the need for new testing has expanded as well. CIL continues to prepare and provide standards for the analysis of alternative and minor pesticides and herbicides.

### Triazine Herbicide and Metabolite Standards

Atrazine is one of the most widely used herbicides in the world. In recent years, studies on the correlation of physical and reproductive disorders in frogs with Atrazine exposure have been a controversial topic. With CIL's comprehensive collection of carefully purified and prepared standards of Atrazine and its many metabolites, researchers should have some powerful tools to refine their investigations.

### Toxaphene Standards

CIL has put considerable effort into developing the first set of <sup>13</sup>C-labeled Toxaphene standards! Listed by Parlar congener#, our labeled and unlabeled standard offerings continue to grow, so keep an eye on our website and future product announcements for more details. Our new POPs Toxaphene mixtures are ideal for researchers interested in primary investigations of the most prevalent congeners.

### Pesticide Standard Mixtures

New applications and increased testing by Isotope Dilution MS have led to the development of several new pesticides mixtures being offered for the first time in this catalog. Our new Expanded POPs pesticide calibration series and related spiking mixtures contain all pesticides listed as Stockholm Convention POPs compounds, including the recently added Kepone (aka Chlordecone), HCHs (including Lindane), Pentachlorobenzene, and Endosulfan I and II. These new solutions allow analysts to use preformulated mixtures for detection and quantification of the complete series of these important POPs compounds.

### Chemical Weapon Metabolite Standards

Often quite similar to metabolites of common pesticides, Chemical Weapons metabolite standards assist researchers determine potential contamination from dangerous compounds such as nerve agents and other toxic chemicals. Several metabolites, degradation byproducts and more are represented in this section.

# ULTRAcHECK and standards for EPA methods

*Excellence through measurement*

# Environmental standards from ULTRA Scientific

LGC Standards, in partnership with ULTRA Scientific®, recognised as a leading producer of environmental standards, now offers thousands of organic and inorganic standards covering all the major contaminants.

- Over 25 years of expertise
- ISO Guide 34 accreditation
- Expert local customer service and technical support
- Assistance in finding the right material to suit your needs
- Custom standards tailored to specific individual requirements

## ULTRAcHECK® blind, quality control check standards

ULTRAcHECK® is a series of blind quality control standards used to check whether or not your analytical system is in control. ULTRAcHECK® is designed to mimic real world samples for specific EPA methods and run as blind samples. The analytical data generated using the method is then compared to the true value supplied with the ULTRAcHECK® standard. Agreement between the data generated for ULTRAcHECK® used as a blind sample and the true value of the ULTRAcHECK® standard indicated that the analytical system is in control.

Use ULTRAcHECK® on a Regular Basis to:

Train Personnel  
Establish and maintain EPA method proficiency  
Verify analytical system accuracy and precision

ULTRAcHECK® true values are provided in a separate, sealed envelope. Data obtained using the ULTRAcHECK® blind sample can be immediately compared against true values supplied. Complete instructions are included with each sample.

## EPA Method 503.1

### Volatile aromatics and unsaturated organic compounds

Method 503.1 is applicable for the determination of volatile aromatic and unsaturated compounds. It is purge and trap method, using GC with a high temperature photoionization detector.

### EPA Method 504, 504.1

#### EDB, DBCP, and 123TCP

Method 504 is used to measure low concentrations of 1,2-dibromo-3-chloropropane (DBCP) and 1,2-dibromoethane (EDB). It is an extraction method, using GC with a capture column and electron capture detector. Method 504.1 adds 1,2,3-trichloropropane to the analyte list.

#### Recommended Standards

##### Method 504

### EPA Method 505

#### Organohalide pesticides and aroclors

Method 505 is used to analyse for organohalide pesticides and commercial PCBs. It is a microextraction method, using GC with a capillary column and electron capture detector.

## EPA 600 Methods

### Analysis of organic compounds in industrial and municipal waste water discharges.

The 600 series methods are designed for monitoring organic pollutants in industrial and municipal discharges under the Clean Water Act.

ULTRA Scientific has prepared a series reference standards for the 60 series methods as well as the necessary surrogate and internal standards. Each analyte in a reference standard is pre-analysed, with most analytes being >99% pure. All solvents are of the highest quality available. All solutions are gravimetrically prepared to a precision of ±0.5%. A certificate showing the actual weights used is supplied with each mixture.

## EPA Method 604

### Phenols

Method 604 is used to measure phenols. Samples are extracted, then concentrated in a Kuderna-Danish apparatus. Quantitation is by GC/FID, or the extract is derivatised and determined by GC/ECD.

## EPA 8000 Methods

### Reference materials for monitoring organic pollutants in ground water

The 8000 series are used for monitoring organic pollutants in ground water as prescribed in the Resource Conservation and Recovery Act.

ULTRA Scientific has prepared a series reference standards for the 8000 series methods as well as the necessary surrogate and internal standards. Each component in a reference standard is pre-analysed, with most analytes being >99% pure. All solvents are of the highest quality available. All solutions are gravimetrically prepared to a precision of ±0.5%. A certificate showing the actual weights used is supplied with each mixture.

### EPA Method 8010B

#### Volatile halocarbons

Method 8010B is used to determine volatile halogenated organic pollutants using either purge or trap or direct injection and an electrolytic conductivity (Hall) detector.

#### Recommended standards

## EPA Method 8150B, 8151

### Chlorinated herbicides

Method 8150B and 8151 are used to measure chlorinated herbicides using extraction followed by derivatisation. Quantitation is carried out by GC/ECD.

## EPA Method 8270D

### Semi-volatiles organic compounds and appendix IX semi-volatiles

Method 8270D is a capillary column GC/MS method for semi-volatile organics using a capillary column.

#### Recommended standards

Calibration standards: U-US-121K  
 Internal standard: U-US-108N  
 Surrogate standards: U-ISM-280N  
 U-ISM-290N  
 U-ISM-333X

## EPA Methods 8280B & 8290A

### Polychlorinated dibenzo-p-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs)

EPA Methods 8280B and 8290A are high resolution GC methods. Method 8280B uses low-resolution mass spectrometry for detection (HRGC/LRMS), while 8290A uses high-resolution mass spectrometry (HRGC/HRMS) to quantitate the compounds of interest.

<b>New</b>	U-PANAL0187	Benzonitrile (as N) - 5000 mg/L in Toluene	5 x 2 mL

### Benzonitrile (as N) kit (low)

<b>New</b>	U-PANAL0237	Benzonitrile (as N) kit (low)	4 x 2 mL
Each kit contains:			
<b>Description .</b>		<b>Concentration</b>	
Ampoule 1.... Toluene.....		Solvent blank	
Ampoule 2.... Benzonitrile (as N) in Toluene .....		1 mg/L	
Ampoule 3.... Benzonitrile (as N) in Toluene .....		5 mg/L	
Ampoule 4.... Benzonitrile (as N) in Toluene .....		10 mg/L	

### Benzonitrile (as N) kit (high)

<b>New</b>	U-PANAL0238	Benzonitrile (as N) kit (high)	4 x 2 mL
Each kit contains:			
<b>Description .</b>		<b>Concentration</b>	
Ampoule 1.... Benzonitrile (as N) in Toluene .....		100 mg/L	
Ampoule 2.... Benzonitrile (as N) in Toluene .....		200 mg/L	
Ampoule 3.... Benzonitrile (as N) in Toluene .....		500 mg/L	
Ampoule 4.... Benzonitrile (as N) in Toluene .....		1000 mg/L	

### Ultra low nitrogen Standards

<b>New</b>	U-PANAL0228	Ultra low nitrogen standard kit	6 x 2 mL
Each kit contains:			
<b>Description .</b>		<b>Concentration</b>	
Ampoule 1.... Toluene.....		Solvent blank	
Ampoule 2.... Pyridine (as N) in Toluene .....		50 µg/L	
Ampoule 3.... Pyridine (as N) in Toluene .....		100 µg/L	
Ampoule 4.... Pyridine (as N) in Toluene .....		200 µg/L	
Ampoule 5.... Pyridine (as N) in Toluene .....		500 µg/L	
Ampoule 6.... Pyridine (as N) in Toluene .....		1000 µg/L	

<b>New</b>	U-PANAL0228-1	Toluene (blank)	2 mL
<b>New</b>	U-PANAL0228-2	Pyridine (as N) - 50 µg/L in Toluene	2 mL
<b>New</b>	U-PANAL0228-3	Pyridine (as N) - 100 µg/L in Toluene	2 mL
<b>New</b>	U-PANAL0228-4	Pyridine (as N) - 200 µg/L in Toluene	2 mL
<b>New</b>	U-PANAL0228-5	Pyridine (as N) - 500 µg/L in Toluene	2 mL
<b>New</b>	U-PANAL0228-6	Pyridine (as N) - 1000 µg/L in Toluene	2 mL

### Total nitrogen (TN) water applications standards kit (low)

<b>New</b>	U-PANAL0225	Ammonium sulfate (as N) + Sodium nitrate (as N) - kit	6 x 10 mL
Each kit contains:			
<b>Description .</b>		<b>Concentration</b>	
Ampoule 1 Water.....		Solvent blank	
Ampoule 2 Ammonium sulfate (as N) in Water .....		0.5 mg/L	
Sodium nitrate (as N) in Water .....		0.5 mg/L	
Ampoule 3 Ammonium sulfate (as N) in Water .....		1.0 mg/L	
Sodium nitrate (as N) in Water .....		1.0 mg/L	
Ampoule 4 Ammonium sulfate (as N) in Water .....		2.5 mg/L	
Sodium nitrate (as N) in Water.....		2.5 mg/L	
Ampoule 5 Ammonium sulfate (as N) in Water .....		5.0 mg/L	
Sodium nitrate (as N) in Water .....		5.0 mg/L	
Ampoule 6 Ammonium sulfate (as N) in Water .....		12.5 mg/L	
Sodium nitrate (as N) in Water.....		12.5 mg/L	

### Total nitrogen (TN) water applications standards kit (medium)

<b>New</b>	U-PANAL0226	Ammonium sulfate (as N) + Sodium nitrate (as N) - kit	6 x 10 mL
Each kit contains:			
<b>Description .</b>		<b>Concentration</b>	
Ampoule 1 Water.....		Solvent blank	
Ampoule 2 Ammonium sulfate (as N) in Water .....		5.0 mg/L	
Sodium nitrate (as N) in Water.....		5.0 mg/L	
Ampoule 3 Ammonium sulfate (as N) in Water .....		12.05 mg/L	
Sodium nitrate (as N) in Water .....		12.5 mg/L	
Ampoule 4 Ammonium sulfate (as N) in Water .....		25.0 mg/L	
Sodium nitrate (as N) in Water.....		25.0 mg/L	
Ampoule 5 Ammonium sulfate (as N) in Water .....		37.5 mg/L	
Sodium nitrate (as N) in Water .....		37.5 mg/L	
Ampoule 6 Ammonium sulfate (as N) in Water .....		50.0 mg/L	
Sodium nitrate (as N) in Water.....		50.0 mg/L

Ampoule 5 ... Trichlorophenol (as Cl) in Isooctane .....	15 mg/L		
Ampoule 6 ... Trichlorophenol (as Cl) in Isooctane .....	25 mg/L		

**Aldrin (as Cl)**

<b>New</b>	U-PANAL0097	Hexane (blank)	5 x 2 mL
<b>New</b>	U-PANAL0095	Aldrin (as Cl) standard kit	10 x 2 mL
Each kit contains:			
<b>Description .....</b>		<b>Concentration</b>	
Ampoule 1-5 .....	Hexane .....	Solvent blank	
Ampoule 6 -10 .....	Aldrin (as Cl) in Hexane .....	5.0 mg/L	
<b>New</b>	U-PANAL0230	Aldrin (as Cl) - 10 mg/L in Hexane	5 x 2 mL
<b>New</b>	U-PANAL0096	Aldrin (as Cl) - 50 mg/L in Hexane	5 x 2 mL
<b>New</b>	U-PANAL0131	Aldrin (as Cl) - 100 mg/L in Hexane	5 x 2 mL
<b>New</b>	U-PANAL0229	Standard Aldrin (as Cl) Set	4 x 2 mL
Each kit contains:			
<b>Description .</b>		<b>Concentration</b>	
Ampoule 1 ... Hexane .....	Solvent blank		
Ampoule 2 ... Aldrin (as Cl) in Hexane .....	0.1 mg/L		
Ampoule 3 ... Aldrin (as Cl) in Hexane .....	0.5 mg/L		
Ampoule 4 ... Aldrin (as Cl) in Hexane .....	1.0 mg/L		

**AOX standard**

<b>New</b>	U-PANAL0094	AOX standard (p-Chlorophenol) - 200 mg Cl/L in Water	20 mL
------------	-------------	--	-------

**POX standard**

<b>New</b>	U-PANAL0102	POX standard (Dichloromethane) - 100 mg/L in Ethanol	10 mL

# Certified high purity standards and high purity inorganic chemicals

*Excellence through measurement*

## Phytochemical reference standards from ChromaDex

### More than 2500 reference substances for phytochemical analysis

- Certified Reference Materials (CRM)
- Botanical Reference Materials (BRM)
- Extract Reference Materials (XRM)
- Standards with various documentation grades
- Reference standard kits
- Analytical methods

### Reference standards for/from:

- Artichoke
- Belladonna
- Bilberry
- Black Cohosh
- Carotenoids
- Cat's Claw
- Devil's Claw

- Echinacea
- Ephedra
- Ginseng
- Kava Kava
- Reishi Mushroom
- Rosemary
- Soysaponins
- St. John's Wort
- Tribulus Terrestris
- Valerian
- ... and many more

NIST-2141	Urea - Nitrogen Certified value N ..... 46.635 %	2 g
NIST-2143	p-Fluorobenzoic acid - Fluorine Certified value F ..... 13.54 %	2 g
NIST-2144	m-Chlorobenzoic acid - Chlorine Certified value Cl ..... 22.62 %	2 g
NIST-1216	Carbon modified silica - Carbon Certified values <u>Level I</u> C ..... 0.7 % <u>Level II</u> C ..... 9.06 % <u>Level III</u> C ..... 17.04 %	set

## Stoichiometry

	Code	Product	Unit
<b>New</b>	NIST-84L	Potassium hydrogen phthalate - Acidimetric value Certified purity..... 99.9934% ± 0.0076%	60 g
	NIST-350b	Benzoic acid - Acidimetric value This Standard Reference Material <sup>®</sup> (SRM <sup>®</sup> ) consists of highly purified benzoic acid (C <sub>6</sub> H <sub>5</sub> COOH). NIST-350b is intended for use in acidimetric standardization. The certified values are based on the results of determinations from 12 randomly selected bottles from the entire lot of NIST-350b. Each determination was obtained by coulometric acidimetric titration to the inflection point (pH ca. 8.15). W <sub>C<sub>6</sub>H<sub>5</sub>COOH</sub> ..... 9.9978 % ± 0.0044 % V <sub>H+</sub> ..... 188 40 mol kg <sup>-1</sup> ± 0.000 26 mol kg <sup>-1</sup>	30 g
	NIST-973	Boric acid - Acidimetric standard This Standard Reference Material (SRM <sup>®</sup> ) is certified as a chemical of known assay and is intended for use as a primary acidimetric standard. The SRM consists of highly purified boric acid (H <sub>3</sub> BO <sub>3</sub> ) in a 100 g bottle. W <sub>C<sub>6</sub>H<sub>5</sub>COOH</sub> ..... 100.009 % ± 0.010 %	100 g
	NIST-723d	2-Amino-2-(hydroxymethyl)-1,3-propanediol (THAM, Tris) - Acidimetric standard Certified value (mass fraction) for Tris, acidimetric assay Tris ..... 99.924 % ± 0.036 %	50 g
	NIST-136f	Potassium dichromate - Oxidimetric value Certified purity..... 99.9954 %	60 g
	NIST-351a	Sodium carbonate - Acidimetric standard This Standard Reference Material (SRM <sup>®</sup> ) is certified as a chemical of known assay and is intended for use as a primary acidimetric standard. The SRM consists of highly purified sodium carbonate (Na <sub>2</sub> CO <sub>3</sub> ) in a 50 g unit. Certified purity..... 99.970 %	50 g
	NIST-987	Strontium carbonate - Assay/isotopic composition Certified values Purity..... 99.98 % <sup>87</sup> Sr ..... 7.0015 % <sup>84</sup> Sr..... 0.5574 % <sup>88</sup> Sr..... 82.5845 % <sup>86</sup> Sr ..... 9.8566 %	1 g
	NIST-999b	Potassium chloride - Assay values Certified purity KCl ..... 99.977 %      K ..... 52.4379 %      Cl ..... 47.5519 % Indicative values for Br, alkalinity	30 g
	NIST-RM 8040	Sodium oxalate - Reductometric This Reference Material (RM) was prepared to provide material of uniform, high purity for use as a working standard for oxidation-reduction reactions. Reference value Reductometric assay (mass fraction) ..... 99.951 % ± 0.038 %	60 g
<b>New</b>	NIM-GBW06103B	Sodium chloride - Assay standard for chloride Certified value for purity is given	50 g
	NCS GC76210	Benzene Certified purity..... 99.95 %	5 mL
<b>New</b>	NIM-GBW06106C	Potassium hydrogen phthalate - Purity Certified purity..... 99.988 %	50 g
<b>New</b>	NIM-GBW06107C	Sodium oxalate Certified purity..... 99.7 %	50 g
<b>New</b>	NIM-GBW06108A	Zinc oxide - Complexometric standard Certified value is given in the certificate	50 g
<b>New</b>	NIM-GBW06109A	Potassium chloride - Assay standard for chloride Certified values for Cl and K are given in the certificate	50 g
<b>New</b>	NIM-GBW06110C	Potassium iodate - Oxidimetry Certified purity..... 99.97 % (as oxidation of potassium iodate)	50 g
<b>New</b>	NIM-GBW06105D	Potassium dichromate - Oxidimetry Certified purity..... 99.979 % (as oxidation of potassium dichromate)	50 g

NIST-RM 8573	L-Glutamic acid - Carbon-13 and nitrogen-15 isotopes (USGS40) This reference materials is intended to aid in normalizing isotope-amount ratio data as well as developing and validating methods for measuring the relative difference in carbon and nitrogen isotope-amounts ratios in biological materials. It should be used in conjunction with NIST-RM 8574. Please ask for further details.	1 g
NIST-RM 8574	L-Glutamic acid - Carbon-13 and nitrogen-15 isotopes (USGS41) This reference materials is intended to aid in normalizing isotope-amount ratio data as well as developing and validating methods for measuring the relative difference in carbon and nitrogen isotope-amounts ratios in biological materials. It should be used in conjunction with NIST-RM 8573. Please ask for further details.	0.5 g
IAEA-305	Ammonium sulphate - Nitrogen-15 2 x 100 mg of Ammonium sulfate ( <sup>15</sup> NH <sub>4</sub> ) <sub>2</sub> SO <sub>4</sub> in solid, crystalline form Assessed values IAEA-305A <sup>15</sup> N.....39.8 per mille IAEA-305B <sup>15</sup> N.....375.3 per mille	unit
IAEA-311	Ammonium sulphate - Nitrogen-15 Assessed value <sup>15</sup> N.....2.05 %	100 mg
IAEA-303	Sodium bicarbonate - Carbon-13 Assessed values <u>Solution A</u> <sup>13</sup> C..... 93.3 activity/mL <u>Solution B</u> <sup>13</sup> C..... 466 activity/mL	2 x 3 mL
IAEA-304	Oxygen-18 labelled water Two Oxygen-18 labelled water samples (A and B) prepared from oxygen-18 enriched water and diluted with distilled water Sample A Assessed value:..... <sup>18</sup> O ..... 251.7δD <sub>VSMOW</sub> * Sample B Assessed value:..... <sup>18</sup> O ..... 502.5δD <sub>VSMOW</sub> * *The isotopic compositions are given in parts per thousand difference from isotope ratio standard Vienna Standard Mean Ocean Water (VSMOW).	2 x 10 mL

## High purity inorganic chemicals

LGC Standards is committed to providing the highest-purity inorganic chemicals for the most demanding applications from MV Laboratories. Their core technology is the development and application of synthetic methods for the removal of trace impurities on the part-per-million range. They are able to do this without the use of zone refining, sublimation, or other techniques that typically add costs to the manufacturing process. This technology, combined with an expertise in inorganic synthesis, allows cost-effective production of hundreds of compounds with purities from 99.99% up to 99.9999%. As a global leader in the production of chemicals of ultra-high-purity inorganic chemicals for chemical analysis and synthesis, crystal growth, nanotechnology, special ceramics, and photonics research and development, MV Laboratories provides our customers with materials and services second to none. They remove trace impurities down to the sub-ppm range and employ the best quality control standards in the industry to guarantee the purity of their wide range of chemicals. Analytical documentation is created for each product test performed. MV Laboratories is dedicated to offering the most comprehensive certificate of analysis available on the market today.

**Custom synthesis:** MV Laboratories can prepare hundreds of inorganic materials, used in a variety of applications, in quantities ranging from a few gram to hundred of kilograms, including:

Hydrogen hexachloroplatinate, 99.999%	Fuel cell applications
Ammonium hexafluorotitanate, 99.99%	Nanotechnology
Hydrogen tetrachloroaurate hydrate, 99.999%	Catalysis
Tellurium dioxide, 99.999%	Crystal growth
Ytterbium chloride hexahydrate, 99.999%	Fiber optics
Yttrium oxide, 99.999%	Lasers
Indium oxide, 99.999%	Photovoltaics

# Reference nanomaterials from LGC Standards

LGC Standards has introduced a range of reference nanomaterials to aid research and testing into the applications and impacts of nanotechnology.

Nanomaterials are now used in a wide range of applications from food packaging and sunscreens to surface coatings and sports equipment. With the increasing presence of nanomaterials in new products, there has been a substantial increase in research into their manufacture, characterisation and applications and this has been matched by growth in demand for characterised reference materials

Master samples of the NM-series reference nanomaterials are stored in the nanomaterials repository of the European Commission's Joint Research Centre (JRC). The JRC distributes these master samples for use by EU Member States' authorities and in the OECD's Working Party on Manufactured Nanomaterials programme. The materials have been characterised using OECD recommended test methods and may serve as:

- Performance standard materials for testing and test method development
- Control materials for safety testing
- Testing materials for reference result and predictive toxicity testing

The series of reference nanomaterials have been selected based on their industrial and commercial importance and include:

**Carbon nanotubes**

**Silver nanoparticles**

**Titanium dioxide**

**Cerium oxide**

**Zinc oxide**

**Silicon dioxide**

### Enthalpy and heat capacity

Code	Product	Unit
LGC2601	Indium - DSC calibration standard This certified reference material is intended for use in the calibration of differential scanning calorimeters and similar instruments. Certified values Enthalpy of fusion ..... 3.296 kJ/mol      Melting temperature ..... 156.61 °C	500 mg
LGC2603	Naphthalene - DSC calibration standard This certified reference material is intended for use in the calibration of differential scanning calorimeters and similar instruments. Certified values Enthalpy of fusion ..... 18.923 kJ/mol      Melting temperature ..... 80.23 °C	500 mg
LGC2604	Benzil - DSC calibration standard This certified reference material is intended for use in the calibration of differential scanning calorimeters and similar instruments. Certified values Enthalpy of fusion ..... 23.26 kJ/mol      Melting temperature ..... 94.85 °C	500 mg
LGC2605	Acetanilide - DSC calibration standard This certified reference material is intended for use in the calibration of differential scanning calorimeters and similar instruments. Certified values Enthalpy of fusion ..... 21.793 kJ/mol      Melting temperature ..... 114.34 °C	500 mg
LGC2606	Benzoic acid - DSC calibration standard This certified reference material is intended for use in the calibration of differential scanning calorimeters and similar instruments. Certified values Enthalpy of fusion ..... 17.98 kJ/mol      Melting temperature ..... 122.35 °C	500 mg
LGC2607	Diphenylacetic acid - DSC calibration standard This certified reference material is intended for use in the calibration of differential scanning calorimeters and similar instruments. Certified values Enthalpy of fusion ..... 31.16 kJ/mol      Melting temperature ..... 147.19 °C	500 mg
LGC2608	Lead - DSC calibration standard This certified reference material is intended for use in the calibration of differential scanning calorimeters and similar instruments. Certified values Enthalpy of fusion ..... 4.765 kJ/mol      Melting temperature ..... 327.47 °C	500 mg
LGC2609	Tin - DSC calibration standard This certified reference material is intended for use in the calibration of differential scanning calorimeters and similar instruments. Certified values Enthalpy of fusion ..... 7.187 kJ/mol      Melting temperature ..... 231.92 °C	500 mg
LGC2610	Biphenyl - DSC calibration standard This certified reference material is intended for use in the calibration of differential scanning calorimeters and similar instruments. Certified Values Enthalpy of fusion ..... 18.60 kJ/mol      Melting temperature ..... 68.93 °C	500 mg
LGC2611	Zinc - DSC calibration standard This certified reference material is intended for use in the calibration of differential scanning calorimeters and similar instruments. Certified values Enthalpy of fusion ..... 7.103 kJ/mol      Melting temperature ..... 419.53 °C	500 mg
LGC2612	Aluminium - DSC calibration standard This certified reference material is intended for use in the calibration of differential scanning calorimeters and similar instruments. Certified values Enthalpy of fusion ..... 10.827 kJ/mol      Melting temperature ..... 660.33 °C	500 mg

LGC2613	Phenyl salicylate - DSC calibration standard This certified reference material is intended for use in the calibration of differential scanning calorimeters and similar instruments. Certified values Enthalpy of fusion ..... 19.18 kJ/mol      Melting temperature ..... 41.79 °C	500 mg
LGC2013	DSC purity set A series of mixtures of benzil in biphenyl intended for evaluating various features of the DSC technique (e.g. bias, repeatability, applicable impurity range) when the technique is used for determining the impurity content of organic compounds.. Certified values Total impurity (mole %)      Uncertainty (mole %)      Total impurity (mole %)      Uncertainty (mole %) 0.1 ..... 0.1      2.1 ..... 0.2 1.1 ..... 0.2      2.6 ..... 0.2 1.6 ..... 0.2      3.1 ..... 0.2	6 x 500 mg
NIST-2232	Indium - DSC calibration standard DSC calibration standard Certified values Enthalpy of fusion ..... 28.51 J/g      Melting temperature ..... 156.5985 °C	1 g
NIST-2235	Bismuth - DSC calibration standard Certified values Enthalpy of fusion ..... 53.146 J/g      Fusion temperature ..... 544.556 K	1.5 g
NIST-2225	Mercury - DSC calibration standard Certified values Enthalpy of fusion ..... 11.469 kJ/mol      Melting temperature ..... 234.30 K	2.5 g
NIST-705A	Polystyrene - Heat capacity and molecular weight Molecular weight (MW) values, measured using various techniques, and limiting viscosity (LV) numbers. Certified values M <sub>n</sub> by membrane osmometry ..... 170,900 g/mol      LV in benzene (25 °C) ..... 74.3 mL/g M <sub>w</sub> by light scattering ..... 179,300 g/mol      LV in benzene (25 °C) ..... 74.5 mL/g M <sub>w</sub> by sedimentation equilibrium ..... 189,800 g/mol      LV in cyclohexane (25 °C) ..... 35.4 mL/g For heat capacity please ask for detailed list	5 g
NIST-720	Synthetic sapphire - Enthalpy and heat capacity Relative enthalpy and heat capacity from 10 to 2250 K	15 g
NIST-781D2	Molybdenum - Enthalpy and heat capacity Relative enthalpy and heat capacity from 273.15 to 2800 K	Each
NIST-1514	Thermal analysis purity set Set of 4 x 0.5 g A set of materials containing pure phenacetin and phenacetin doped with nominal 0.7, 2 and 5 mol percent of p-aminobenzoic acid	set (4)

## Melting, freezing and triple points

LGC2411	Phenyl salicylate - Melting point This certified reference material is intended for use in checking and calibrating apparatus used for determining melting points of samples in glass tubes. Certified values Thermodynamic melting point ..... 41.50 °C Dynamic melting points (0.2 °C/min heating rate): Onset of melting ..... 41.55 °C Meniscus point ..... 41.70 °C Liquefaction point ..... 41.85 °C	500 mg
LGC2401	4-Nitrotoluene - Melting point This certified reference material is intended for use in checking and calibrating apparatus used for determining melting points of samples in glass tubes. Certified values Dynamic melting points (0.2 °C/min heating rate): Onset of melting ..... 51.36 °C Meniscus point ..... 51.58 °C Liquefaction point ..... 51.71 °C	2 x 250 mg

## Flash point

ERM-FC032	n-Nonane The certified value was determined by the Abel closed cup method described in the Institute of Petroleum Standard IP170/95 and also published as British Standard BS2000:Part 170: 1995. The certified value is corrected to standard barometric pressure at 0°C. Certified value Non-equilibrium flash point ..... 32.5 °C	100 mL
ERM-FC033	n-Decane The certified value was determined by the Abel closed cup method described in the Institute of Petroleum Standard IP170/95 and also published as British Standard BS2000:Part 170: 1995. The certified value is corrected to standard barometric pressure at 0°C. Certified value Non-equilibrium flash point ..... 50 °C	100 mL
LGC2000	Diethyl phthalate This certified reference material is intended for use in checking and calibrating apparatus used for determining flash point by closed cup equilibrium methods. The certified value was determined from the results of an interlaboratory study, where the participants used IP/304 Pensky-Martens Closed Cup or IP/303 Setaflash methods. Certified value Equilibrium closed cup flash point ..... 159.0 °C	500 mL

## Combustion calorimetry

NIST-39J	Benzoic acid - Heat of combustion Certified value ..... 26.434 MJ/kg	30 g
NIST-1656	Thianthrene - Heat of combustion Certified value ..... 33.480 MJ/kg	30 g
NIST-1657	Synthetic refuse-derived fuel - Heat of combustion Certified values HHV* (dry) ..... 13.87 ± 0.25 MJ/kg      Dry ash ..... 20.34 ± 0.54 wt% HHV* (dry, ash free) ..... 17.40 ± 0.30 MJ/kg *HHV (Higher heating value) is the synonym for gross calorific value.	100 g
NIST-2151	Nicotinic acid - Heat of combustion Certified value ..... 22.184 MJ/kg	25 g
NIST-2152	Urea Certified value ..... 10.536 MJ/kg	25 g
NIST-2682b	Coal (sub-bituminous) - Sulphur, mercury and heat of combustion Certified values S ..... 0.4917 %      Hg ..... 108.8 µg/kg Indicative values for chlorine, ash content, gross calorific value	50 g

## Solution calorimetry

NIST-1655	Potassium chloride - water solution calorimetry Intended for use in verifying or comparing results obtained by calorimeters measuring enthalpies of endothermic solution processes. Certified value Heat of solution (absorbed) ..... 235.86 J/g	30 g

<p>For these materials the distribution is expressed as a curve of the cumulative mass of particles undersize versus particle size. In the case of particles of less than 90 µm diameter their size is expressed as the equivalent Stokes' diameter determined from the settling rate of the particles in a viscous fluid. For larger particles the equivalent volume diameter determined by sieving was preferred.</p>

<b>New</b> IRMM-304	Suspension of colloidal silica nanoparticles IRMM-304 is a quality control material of silica nanoparticles suspended in an aqueous solution. Information values (not certified) are assigned for frequency analysis and cumulant method using dynamic light scattering according to ISO 22412, as well as disc sedimentation according to ISO 13318. IRMM-304 is available in 10 mL pre-scored amber glass ampoules containing approximately 9 mL of suspension. The suspending medium is water-based and contains a small amount of NaOH as a stabilising agent. The nominal relative particle mass fraction in the suspension is 0.25 %.	Amp.
	NIST-659 - NIST-RM 8010 These materials are for evaluating and calibrating specific types of particle size measuring instruments, including light scattering, electrical zone flow-through counters, optical and scanning electron microscopes, sedimentation systems and wire cloth sieving devices.

NIST-RM 8631a	<p>Medium Test Dust (MTD)</p> <p>A unit of Reference Material NIST-RM 8631A, an ISO Medium Test Dust (MTD), consists of 20 g of a natural mineral dust that is heterogeneous in composition and polydisperse with respect to size. RM 8631a is intended to be used as a secondary material for calibrating particle sizing instruments, especially optical particle counters, when used in conjunction with either of two published standard methods. RM 8631a can be used in conjunction with either the National Fluid Power Association method (NFPA) method NFPA/T2.9.11 R1-1998 "Hydraulic Fluid Power - Calibration of Liquid Automatic Particle Counters" or the International Standards Organization method ISO 11171:1999 "Hydraulic Fluid Power - Calibration of Liquid Automatic Particle Counters". Using either of these two methods, the particle concentration of RM 8631a at each diameter will be determined by calibration against NIST Standard Reference Material NIST-2806A, Medium Test Dust (MTD) in Hydraulic Fluid.</p> <p>NIST-RM 8632</p> <p>For use in preparing suspensions in other types of oil, further information on request. This material is intended for use in calibrating the response of particle sizing instrumentation, including optical counters, in accordance with National Fluid Power Association (NFPA) and ISO standard methods for determining particle contamination in oils.</p>	20 g

### Particle size calibration standards from Whitehouse Scientific

Whitehouse Scientific has been producing precision glass microspheres for calibration for 25 years and is the highest ranking European certification laboratory for primary methods of particle size analysis. Having filled over 1 million bottles using a unique 100 stage spinning riffler system, they are now the world's leading manufacturer of single-shot glass microsphere standards. The references, nearly all NIST traceable range in size from 0.1µm - 5.0mm and are available as single sizes or broad distribution standards.

Whether calibrating a particle sizing instrument or any aperture in the range 0.1 - 10,000 microns, Whitehouse Scientific has a standard for every application.

<b>Particle flow</b>		
BCR-116	<p>Limestone powders</p> <p>The flow of powders or granulated materials under the force of gravity affects the design and operation of silos used for their bulk storage. The European Federation of Chemical Engineering (EFCE) therefore developed a test method, based on the Jenike Shear Cell, to determine the shear strength of powders under different compaction and loading conditions. The complexity of this method is such that errors due to poor technique can easily arise. This CRM has therefore been produced with which laboratories can verify both their equipment and experimental technique. It is certified for shear stress as a function of normal applied stress for four different powder compaction stresses.</p>	3.2 kg

## Particles and surface properties

Code	Product	Unit
NIST-2831	<p>Vickers Hardness of Ceramics and Hardmetals</p> <p>This Standard Reference Material (SRM<sup>®</sup>) is intended for use in the calibration of all hardness and microhardness testing machines whereby a Vickers indentation is made and then measured with a microscope. The SRM has five NIST-made indents in the middle of a polished face certified for the individual diagonal lengths, the average diagonal length, and the average hardness value for indentations made at a load of 9.8 N (1 kgf). A unit of NIST-2831 consists of a 25 mm D × 9.5 mm disc that has a nominal hardness of approximately 15.0 GPa (1530 kgf/mm<sup>2</sup>) packaged in a wooden box. Each unit is individually certified and bears a serial number scribed on the opposite (bottom) face of the disc. Vickers hardness is calculated as <math>HV = \alpha P/d^2</math>, where P is the indentation load, d is the average diagonal size <math>[(d_1 + d_2)/2]</math>, and <math>\alpha</math> is the indenter constant, which, for an ideal Vickers indenter is 1.8544. If P is in units of Newton, and d is in units of meters, then HV will be in units of N/m<sup>2</sup> or Pa. A conversion factor of <math>1 \times 10^{-9}</math> may be used to convert HV to units of GPa. In this certificate, older traditional units of hardness expressed as kgf/mm<sup>2</sup> are also included in parenthesis for the convenience of users.</p>	Each

NIST-2134	Arsenic in silicon - Depth profile This Standard Reference Material® (SRM®) is intended for use in calibrating secondary ion response to minor and trace levels of arsenic in a silicon matrix by the analytical technique of secondary ion mass spectrometry (SIMS). NIST-2134 is intended for calibrating the response of a SIMS instrument for arsenic in a silicon matrix under a specific set of instrumental conditions. It may also be used by a laboratory as a transfer standard for the calibration of working standards of arsenic in silicon. This SRM consists of a 1 cm x 1 cm single crystal silicon substrate that has been ion implanted with the isotope <sup>75</sup> As at a nominal energy of 100 keV. NIST-2134 is certified for the retained dose of 75 As atoms. The dose is expressed in units of arsenic mass per unit area. Additional noncertified information about the concentration of arsenic atoms as a function of depth below the surface is provided by SIMS. The total retained dose of <sup>75</sup> As atoms was determined by instrumental neutron activation analysis. 	<b>NIST-1358B - NIST-1364B</b> These NIST Standard Reference Materials® are suitable for calibrating instruments used in the measurement of organics and nonmagnetic inorganic coatings on steel. They consist of fine grained copper of varying thicknesses electrodeposited onto low carbon steel substrates having the properties of AISI 1010 steel. These uniform coatings are then overplated with a thin protective layer of chromium and the total coating thickness is then certified.

## Reference Nanomaterials

### LGC Standards introduces reference nanomaterials range

LGC Standards has introduced the NM series reference nanomaterials to aid research and testing into the applications and impacts of nanotechnology.

One of the most comprehensive nanomaterial research programmes is being carried out by the Organisation for Economic Co-operation and Development's (OECD) Working Party on Manufactured Nanomaterials (WPMN). This programme focuses on the implications of the use of nanomaterials for human health and environment safety, focusing on testing and assessment methods. Master samples of the NM-series reference nanomaterials are stored in the nanomaterials repository of the European Commission's Joint Research Centre (JRC). The JRC distributes these master samples for use by EU Member States' authorities and in the OECD's Working Party on Manufactured Nanomaterials programme.

The NM nanomaterials available from LGC Standards encompass the OECD WPMN priority list of nanomaterials. These materials have been selected based on commercial importance and have been characterised using OECD recommended test methods and may serve as:

- Performance standard materials for testing and test method development
- Control materials for safety testing
- Testing materials for reference result and predictive toxicity testing

The materials have been produced from a selected homogenised master batch of raw material and sub-sampled under Good Laboratory Practice (GLP) conditions. The homogeneity and stability of all the samples follow the principles of ISO Guide 34 and are continuously monitored for stability under an isochronous monitoring study scheme.

### Reference data

The NM nanomaterials are supplied with a Material Information Sheet. Available information includes material identification data such as CAS number, structural formula/molecular structure, composition (including degree of purity, known impurities or additives), basic morphology and surface chemistry.

Extensive data on the endpoints tested is being collated to provide further information on the material's Physical-Chemical Properties and Material Characterization, Environmental Fate and Mammalian Toxicology.

### REACH applications:

The EU REACH regulations covering the Registration, Evaluation, Authorisation, and Restriction of Chemical Substances applies to nanomaterials.

As stated in the REACH guidance, registration dossiers should include "Available information from assessments carried out under other international and national programmes (...). Deviations from such assessments shall be justified". For nanomaterials an important source of assessments is those carried out by the Organisation for Economic Co-operation and Development's Working Party on Manufactured Nanomaterials, using these NM series products.

<b>New</b> NIST-2942	Relative intensity correction standard for fluorescence spectroscopy (Ultraviolet emission) 310 nm This Standard Reference Material (SRM) is intended for use in the evaluation and calibration of the relative spectralresponsivity of steady-state fluorescence spectrometers with a continuous excitation source and for determining the day-to-day or instrument-to-instrument intensity variations of a single or similar fluorescence instrument(s), respectively. A unit of NIST-2942 consists of a single cuvette-shaped piece of solid glass. This SRM is certified for the relative, corrected emission spectrum, E, in relative energy unitsfrom emission wavelengths $\lambda_{EM} = 320 \text{ nm}$ to $430 \text{ nm}$ at $1 \text{ nm}$ wavelength intervals at a fixed excitation wavelength ( $\lambda_{EX}$ ) of $310.1 \text{ nm}$ . <b>New</b> NIST-2943	Relative intensity correction standard for fluorescence spectroscopy (Blue emission) This Standard Reference Material® (SRM®) is intended for use in the evaluation and calibration of the relative spectral responsivity of steady-state fluorescence spectrometers with a continuous excitation source and for determining the day-to-day or instrument-to-instrument intensity variations of a single or similar fluorescence instrument(s), respectively. NIST-2943 is a copper-doped (mole fraction of $0.01 \%$ $\text{Cu}_2\text{O}$ ) phosphate-matrix glass. A unit of NIST-2943 consists of a single cuvette-shaped piece of solid glass. Each piece is a rectangular solid block with standard cuvette dimensions $12.5 \text{ mm} \times 12.5 \text{ mm} \times 45.0 \text{ mm}$ , with three of the four long faces optically polished and one long face, the top face and the bottom face ground to a frosted finish using a 400 grit polish. The serial number of each unit is etched on the top face. There are 17 units of NIST-2943 Sample Series with serial numbers Cu0xx through yy. This SRM is certified for the relative, corrected emission spectrum, E, in relative energy units from emission wavelengths $\lambda_{EM} = 350 \text{ nm}$ to $640 \text{ nm}$ at $1 \text{ nm}$ wavelength intervals at a fixed excitation wavelength ( $\lambda_{EX}$ ) of $330.3 \text{ nm}$ . Due to larger signal-to-noise levels near the peak maximum, the emission range from $\lambda_{EM} = 380 \text{ nm}$ to $560 \text{ nm}$ is recommended as optimal for most instruments and applications. Note that this standard's certified values become reference values when used for spectral correction of fluorescence spectrometers with pulsed light sources.	Each
NIST-2036	Near infrared wavelength/reflection standard This Standard Reference Material (SRM®) is a certified transfer standard intended for the verification and calibration of the wavelength/wavenumber scale of Near-Infrared (NIR) spectrometers operating in diffuse reflectance mode. NIST-2036 is a glass physically contacted with a piece of sintered polytetrafluoroethylene (PTFE). The combination of the rare earth oxide glass with a nearly ideal diffuse reflector provides reflection-absorption bands that range from approximately $15 \%$ R to $40 \%$ R. NIST-2036 is certified for the $10 \%$ band fraction centroid of seven bands spanning the spectral region from $975 \text{ nm}$ to $1946 \text{ nm}$ (air wavelength). In addition, it is certified for the $10 \%$ band fraction centroid location of the same seven bands in the spectral region from $10300 \text{ cm}^{-1}$ to $5130 \text{ cm}^{-1}$ at $8 \text{ cm}^{-1}$ resolution (vacuum wavenumber).	Each
NIST-2065	Ultraviolet-visible-near-infrared transmission wavelength/vacuum wavenumber standard This Standard Reference Material (SRM®) is a certified standard intended for the verification and calibration of the wavelength/wavenumber scale of ultraviolet (UV)-Visible-Near-Infrared (NIR) spectrometers operating in transmission mode. NIST-2065 is certified for the location of seven absorbance bands (COG) in the spectral region from $10300 \text{ cm}^{-1}$ to $5130 \text{ cm}^{-1}$ at $4 \text{ cm}^{-1}$ resolution. NIST-2065 is a glass consisting of a combination of rare earth oxides. The optical filter is $25 \text{ mm}$ in diameter and $1.5 \text{ mm}$ thick. Please ask for more details.	Each
NIST-2517a	High resolution wavelength calibration reference Intended for wavelength calibration in the spectral region of $1510 \text{ nm}$ to $1540 \text{ nm}$ . NIST-2517a is a single-mode optical-fibre-coupled absorption cell containing acetylene ( $^{12}\text{C}_2\text{H}_2$ ) gas at a pressure of $6.7 \text{ kPa}$ ( $50 \text{ Torr}$ ). The absorption path length is $5 \text{ cm}$ and the absorption lines are about $7 \text{ pm}$ wide.	cell
NIST-2241	Relative Intensity Correction Standard for Raman Spectroscopy Using $785 \text{ nm}$ Excitation NIST-2241 is a chromium-doped ( $0.02 \text{ mol } \%$ $\text{Cr}_2\text{O}_3$ ) sodium borosilicate matrix glass. One unit of this Standard Reference Material® consists of a glass slide that is approximately $10.7 \text{ mm}$ in width $\times$ $30.4 \text{ mm}$ in length $\times$ $2.0 \text{ mm}$ in thickness, with one surface optically polished and the opposite surface ground to a frosted finish using a 400 grit polish. This Standard Reference Material® (SRM®) is a certified spectroscopic standard for the correction of the relative intensity of Raman spectra obtained with instruments employing $785 \text{ nm}$ laser excitation. NIST-2241 consists of an optical glass that emits a broadband luminescence spectrum when excited with $785 \text{ nm}$ laser radiation. The relative spectral intensity of the glass luminescence has been determined through the use of a white-light, uniform-source, integrating sphere that has been calibrated for its irradiance at NIST. The shape of the luminescence spectrum of this glass is described by a polynomial expression that relates the relative spectral intensity to the wavenumber ( $\text{cm}^{-1}$ ) expressed as the Raman shift from the excitation wavelength of $785 \text{ nm}$ . This polynomial, together with a measurement of the luminescence spectrum of the standard, can be used to determine the spectral intensity-response correction that is unique to each Raman system. The resulting instrument-intensity-response correction may then be used to obtain Raman spectra that are instrument independent. This SRM® is intended for use in measurements over the range of $20 \text{ }^\circ\text{C}$ to $25 \text{ }^\circ\text{C}$ and with Raman systems that employ laser excitation at $785 \text{ nm}$ . It may also be used for Raman excitation with lasers that range from $784 \text{ nm}$ to $786 \text{ nm}$ in excitation wavelength.	Each

## Starna optical reference materials

Starna<sup>®</sup> optical reference materials produced by Starna Scientific are available from LGC Standards. Starna Scientific was one of the first reference material producers in the UK to receive accreditation to ISO guide 34. The company has over 30 years experience in the development and production of liquid-filled, heat sealed quartz cells with good long term stability and the optical properties needed to evaluate performance of UV-visible spectrophotometers. The range also includes robust solid glass filter materials for both absorbance and wavelength measurements. These certified reference materials (CRM) for the validation of wavelength accuracy, absorbance accuracy, stray light and resolution in the UV and visible regions, can be used in analytical, clinical and research laboratories. All of the Starna<sup>®</sup> CRMs are traceable to NIST primary standards. Brief descriptions of the types of products available are given below with more detailed product descriptions in the pages that follow.

## Absorbance / transmission

### Potassium dichromate - UV absorbance and linearity

The use of potassium dichromate solvated in perchloric acid is an established and recognised method for the validation of the absorbance scale of UV and visible spectrophotometers. Starna<sup>®</sup> provides sets of certified sealed cells covering absorbance values from 0.2 to 3.0 over the wavelength range from 235nm to 350nm. For the far UV, nicotinic acid is the recognised standard and covers from 210nm to 270nm.

<b>Wavelength</b>		
	Starna® sealed liquid references are available covering all wavelengths from the far UV to the visible. For the UV and visible, rare earth oxides like holmium oxide, didymium (a mixture of neodymium and praseodymium) and samarium solvated in perchloric acid are well recognised as suitable wavelength references.	
STRM-HL	<p><b>Holmium oxide - UV and visible wavelength</b></p> <p>Description: Holmium oxide (4% m/v) in 10% v/v perchloric acid.  Primary usage: Assessment of wavelength scale accuracy in both UV and visible regions.  Useable range: 240 nm to 650 nm, instruments with spectral bandwidth of less than 3 nm.  Physical configuration: Far UV quartz cells that have been permanently heat sealed.</p> <p>Consists of one sealed cell, with certified peak at spectral bandwidth values of 0.10 nm, 0.25 nm, 0.50 nm, 1.00 nm, 1.50 nm, 2.00 nm and 3.00 nm.</p>	cell

<b>Stray light</b>		
<b>Inorganic cut-off filters – UV stray light</b>		
<p>This is a subtle source of error in UV and visible spectrophotometry. A variety of materials is available for measuring this parameter at several different wavelengths in the form of inorganic cut-off filters. They are designed with sharp cut-offs in transmissions at specified wavelengths which will enable any stray light to be measured.</p> <p>Description: Materials with sharp cut-offs in transmission at specified wavelengths.</p> <p>Primary usage: Detection of stray light in the UV region.</p> <p>Useable range: 200 nm to 260 nm, depending on the material.</p> <p>Physical configuration: Far UV quartz cells that have been permanently heat sealed.</p>

## Resolution

<p>Accurate absorbance and wavelength measurements can only be achieved if due consideration is given to the resolution of the monochromator in use. In modern instruments with grating monochromators, the resolution relates directly to the slit chosen. The smaller the slit and its associated spectral bandwidth, the greater the resolution. Simple checks on the resolution power of a spectrophotometer with Starna<sup>®</sup> resolution CRMs such as benzene vapour or toluene in hexane will provide useful references. Benzene vapour is used to validate the resolution of instruments with bandpass less than 1nm. Even this material can be supplied heat sealed into a quartz cell. An alternative liquid reference, toluene in hexane, helps users to meet the recommendations of the current European Pharmacopoeia.</p>														
STRM-TX	<p>Toluene in hexane - resolution</p> <p>Description: 0.020% v/v solution of toluene in hexane.</p> <p>Primary usage: Determination of spectral bandwidth in the UV region.</p> <p>Useable range: 265 nm to 270 nm, instruments with a spectral bandwidth of less than 3 nm.</p> <p>Physical configuration: Far UV quartz cells that have been permanently sealed.</p> <p>This formulation is described and used in the European Pharmacopoeia where the ratio of the peak maximum at 269 nm to the minimum at 266 nm gives a measure of the resolution of the instrument.</p> <p>Ratio table:</p> <table border="1"> <tr> <td>SBW (nm):</td> <td>0.5</td> <td>1.0</td> <td>1.5</td> <td>2.0</td> <td>3.0</td> </tr> <tr> <td>Ratio:</td> <td>2.5</td> <td>2.1</td> <td>1.6</td> <td>1.4</td> <td>1.0</td> </tr> </table>	SBW (nm):	0.5	1.0	1.5	2.0	3.0	Ratio:	2.5	2.1	1.6	1.4	1.0	set

Benzene vapour will not work well with a photodiode array spectrophotometer as this instrument type does not measure a continuum and the peaks will not be resolved well enough to be useable.</p>	cell

## NIR

STRM-RM-NIR	Certified NIR wavelength reference for transmittance measurements	cuV.
	Liquid reference material, permanently heat-fused sealed in a high quality far-uv quartz cuvette. Configuration Transmittance: 10 mm optical path length, both linear path optical window clear, opposed sides "grey" Certification: Complete with certificate of wavelength values and associated expanded uncertainty, for 13 assigned peak values in the range 950 - 2550 nm.	
STRM-RM-NIR/T	Certified NIR wavelength reference for transmittance and trans-flectance measurements	cuV.
	Liquid reference material, permanently heat-fused sealed in a high quality far-uv quartz cuvette. Configuration Transmittance/Trans-flectance: 5 mm or 10 mm optical path length, depending on orientation, In 5 mm configuration, rear window mirror coated to provide reflectance optical return - so path length effectively 2 x 4 = 10 mm Certification: Complete with certificate of wavelength values and associated expanded uncertainty, for 13 assigned peak values in the range 950 - 2550 nm.	

## Reference material for nucleic acid analysis

<b>New</b> STDNACON260280	Wavelength accuracy in critical nucleic acid measurements - 260/280 nm measurement ratio	cell
	This control material has been specifically designed to assure the wavelength accuracy in critical nucleic acid measurements. DNACON260/280 which suffers from none of the inherent stability problems associated with DNA has been created for use as a new reliable NIST traceable Quality Control Standard by clinical and bioscience laboratories analysing and evaluating the purity of a range of nucleic acids such as DNA, RNA, RNAi and ssDNA. It consists of a Far UV quartz cell which has been permanently sealed by heat fusion. It contains a solution of Starna DNACON 260/280, which has been designed to give a spectrophotometric 260/280 nm measurement ratio similar to that achieved when measuring pure DNA. This standard is produced in an ISO 17025 and ISO Guide 34 accredited environment, meeting the highest available regulatory standards.

	PRG 7.21 - PRG 7.8 This group of liquid reference materials, produced by LGC Standards and certified by the Laboratory of Refractometry and Polarimetry of the Central Office of Measures (GUM), Warsaw, covers the wide range of refractive index from 1.333 (water) to 1.657 (1-Bromonaphthalene). The <i>n</i> values were determined on a Pulfrich refractometer, previously calibrated with solid Class 1 CRMs, for which values were established using goniometric procedures. All reference materials are supplied with a certificate. Certified values to 5 significant figures for the refractive index at $\lambda = 589.3$ nm, $t = 20^\circ\text{C}$ and associated uncertainties are given. Reference liquids are packed in glass ampoules (7.1, 7.2, 7.5, 7.6, 7.8) or plastic drop-bottles (7.11, 7.12, 7.20, 7.21).

## Biological buffer systems

<p>NIST-2181 - NIST-2184</p> <p>These materials are intended for use in preparing a standard solution for calibrating clinical instruments (e.g. blood pH measurements), in the physiologically important range of pH 7-8. They are based on a biological buffer system for clinical pH measurements and are certified for use as an admixture only. The pH values for the buffer solutions are certified at 0.05 and 0.08 M with respect to the free acid and the sodium salt admixture as a function of temperature. The certified temperature range is from 0-50 °C.</p>

## Viscosity oil standards

	PSL2700V01 - PSL2700V19 These standards are calibrated by the PSL Calibration ISO 17025 Accredited Laboratory. The standards will be supplied complete with UKAS calibration certificates and have direct traceability to NIST and other international laboratories. Uncertainties of measurement are stated on the calibration certificates. Long shelf lives are provided by using stable base oils. The viscosity oil standards are suitable for the calibration and verification of the following: <ul style="list-style-type: none"> <li>• Glass Capillary viscometers</li> <li>• Automated Kinematic Viscometer Systems</li> <li>• Rotational/Cone &amp; Plate Viscometers</li> <li>• Low Temperature Viscometer Systems</li> <li>• Cold Cranking Simulators</li> <li>• Flow Cups</li> </ul>

## Certified liquids for viscosity measurements in the European Pharmacopoeia

Newtonian liquids with a certified viscosity are supplied by Van Swinden Laboratorium BV and are distributed by LGC Standards.

Liquids are available with kinematic viscosities up to 48000 mm<sup>2</sup>·s<sup>-1</sup> and certified at temperatures between 15°C and 140°C.

Viscosities are certified in mm<sup>2</sup>·s<sup>-1</sup> (kinematic viscosity,  $\nu$ ) or in mPa·s (dynamic viscosity,  $\eta$ )

1 mPa·s = 1 cps (centipoise) 1 mm<sup>2</sup>·s<sup>-1</sup> = 1 cst (centistoke)

Standard liquids are available from stock, in 250 ml packs and certified at 20°C to following viscosities:

$\nu$  = 0,6 ; 1,0 ; 2,2; 4,9 ; 1; 20 ; 31 ; 56 ; 67 ; 85 ; 100 ; 132 ; 167 ; 217 ; 262; 340 ; 423 ; 537 ; 644 ; 783 ; 1000 ; 1260 ; 1800 ; 3650 ; 5075 ; 10175 ; 18400 ; 46500

$\eta$  = 0,4 ; 1,0 ; 1,8; 4,0 ; 8,9 ; 17,0 ; 26,0 ; 48,0 ; 58,0 ; 74,0 ; 87,0 ; 116,0 ; 146,0 ; 191,0 ; 230,0 ; 300,0 ; 375,0 ; 474,0 ; 572,0 ; 700,0 ; 862,0 ; 1085 ; 1560 ; 3175 ; 4430 ; 8935 ; 16300 ; 41300

All viscosities are calibrated relative to the viscosity of pure water. Stated values are nominal values, certified values will not deviate more than 10% from the nominal value.

The uncertainty of the certified viscosities is at least 0.3% at the lowest viscosity, increasing up to 0.5% at 48000 mm<sup>2</sup>·s<sup>-1</sup>.

### Shelf life

Standards up to 500 mPa·s are mineral oil based, and have a shelf life of 12 months from date of certification. Above 500 mPa·s Polyisobutylene is used; these materials have a shorter shelf life, and should be ordered as needed.

Liquids can be prepared and certified to any viscosity between 0.6 mm<sup>2</sup>·s<sup>-1</sup> and 80,000 mm<sup>2</sup>·s<sup>-1</sup>.

The price depends on the viscosity required, the degree of precision between nominal viscosity required and certified viscosity achieved, and temperature of certification.

Additional charges are applied for extra certification temperatures and for certification of dynamic viscosity. Please ask for a quotation.

Liquids supplied by customers may be certified for viscosity, charges vary: please ask for a quotation.

NIST-2491	<p>Non-Newtonian polymer melt for rheology</p> <p>This Standard Reference Material<sup>®</sup> (SRM<sup>®</sup>) is intended primarily for use in calibration and performance evaluation of instruments used to determine the viscosity and first normal stress difference in steady shear, or to determine the dynamic mechanical storage and loss moduli and shift factors through time-temperature superposition. NIST-2491 consists of polydimethylsiloxane. The supplier identifies the polydimethylsiloxane as having a number average molecular mass of 308,000 g/mol. Certified values of the viscosity and first normal stress difference as functions of shear rate are given in the certificate at temperatures of 0 °C, 25 °C, and 50 °C, respectively. The expanded combined uncertainties in the certified values of the viscosity and first normal stress difference are also listed. The certified values of the storage modulus G' and loss modulus G'' as functions of frequency at 0 °C, 10 °C, 20 °C, 30 °C, 40 °C, and 50 °C, respectively are also given in the certificate.</p>	100 mL

NIST-RM 8091	<p>Scanning Electron Microscope Sharpness Standard</p> <p>This Reference Material (RM) is intended primarily for use in checking the sharpness of scanning electron microscopes. It is supplied as a small (3mm x 2 mm) diced semiconductor chip. Please ask for further details.</p>	Each
<b>New</b> NIST-RM 8820	<p>Scanning electron microscope scale calibration artifact</p> <p>Reference Material (RM) 8820 is primarily intended to be used for X and Y scale (or magnification) calibrations from less than 10 times magnifications to more than 100 000 times magnifications in scanning electron microscopes (SEMs). It was designed to provide good contrast at low and high electron landing energies (accelerating voltages). Beyond testing scale calibration, it can be used for non-linearity measurements, especially at lower than 10 000 times magnifications. It can also be used for optical and scanning probe and other types of microscopes. Most SEMs require a set of calibration structures of different sizes to cover the full range of possible magnifications. This Reference Material (in part using the ideas implemented in earlier NIST scale calibration artifacts) is designed to meet that need. A unit of RM 8820 consists of a 20 mm × 20 mm lithographically patterned silicon chip.</p>	35-40 g

### Chemical resistance (durability) of glass

NIST-622 and NIST-623

These NIST Standard Reference Materials<sup>®</sup> are for checking test methods and calibrating equipment used to determine the resistance of glass containers to chemical attack. The values given represent the volume of fiftieth-normal sulphuric acid used to titrate to the methyl red end point of the alkaline extract from a crushed sample of glass after exposure to high purity water at 121 °C.

NIST-622	Soda lime silica (durability) Certified value Volume of 0.02N H <sub>2</sub> SO <sub>4</sub> .....7.67 mL	2.2 kg
NIST-623	Borosilicate glass Certified value Volume of 0.02N H <sub>2</sub> SO <sub>4</sub> .....0.34 mL	2.2 kg

### Multi-test verification materials (MTVMs)

The Multi-Test Verification Materials (MTVMs) are unique because they enable a laboratory to use a single sample to validate different tests and instrumentation. Each unit is supplied with data for multiple types of internationally accepted test methods.

BCR-692	Scratch test reference material A reference material certified for critical loads for cohesive/adhesive failures during scratch testing (prEN 1071-3). The reference samples are (30x30x5) mm steel coupons coated with a diamond-like carbon coating (DLC) applied by plasma-assisted chemical vapour deposition. The coupons are distributed in a reusable plastic box containing desiccant.	coupons
NIST-2100	Fracture Toughness of Ceramics NIST-2100 is intended for verification of fracture toughness testing procedures and consists of a set of five hot-pressed silicon nitride flexure specimens cut from a single billet (plate) of material. This SRM may be used with any fracture toughness test method, but is optimized for beam bending testing configurations. The SRM may be used in conjunction with American Society of Testing and Materials (ASTM) fracture toughness standard C1421-99 (or the Provisional Standard PS070-97 which preceded it) [1]. This SRM may also be used with two International Organization for Standardization (ISO) standard tests under development by ISO Technical Committee TC 206, Fine Ceramics.	5 bars

### Magnetic moment

NIST-762	Magnetic moment standard - Nickel disc This Standard Reference Material <sup>®</sup> (SRM <sup>®</sup> ) is intended for use in the calibration of magnetometers (such as vibrating sample magnetometers) used in the measurement of the magnetic properties of materials. NIST-762 consists of a nickel disc nominally 6 mm in diameter with a thickness of 0.127 mm and a mass of 32 mg ± 1 mg. The NIST-762 lot was produced from rolled nickel sheet with a purity of 99.999 %. Discs were punched from the sheet. Before measurement, the discs were ultrasonically cleaned in acetone, then methyl alcohol. The certified value for specific magnetization, σ at 298 K and in an applied magnetic field of 398 kA/m (5000 oersted, Oe) with the magnetic field aligned parallel to the plane of the disc is: σ = 54.78 A m <sup>2</sup> /kg ± 0.15 A m <sup>2</sup> /kg (54.78 emu/g ± 0.15 emu/g)	6 mm dia.
NIST-764a	Magnetic susceptibility standard - Platinum cylinder This Standard Reference Material (SRM <sup>®</sup> ) is intended for use in the calibration of magnetometers (such as vibrating sample magnetometers) used in the measurement of the magnetic properties of materials. NIST-764a consists of a platinum (Pt) cylinder with a nominal diameter of 3 mm, a nominal length of 3.42 mm, and a nominal mass of 620 mg. NIST-764a lot was produced by slicing a pure (99.99 %) platinum rod into 3.42 mm long pieces.	3 mm dia.
NIST-2853	Magnetic moment standard yttrium iron garnet sphere This Standard Reference Material (SRM <sup>®</sup> ) is intended for use in calibrating of magnetometers (such as vibrating sample magnetometers) used in the measurement of the magnetic properties of materials. NIST-2883 consists of a yttrium iron garnet (YIG) sphere with a nominal diameter of 1 mm and a nominal mass of 2.8 mg.	Each

## ULTRASep™ Filters

### ULTRASep™ TSS Filters for Standard Methods 2540C and 2540D

ULTRASep™ TSS Filters are specifically designed to ensure compliance with the filter preparation requirements of Standard Methods 2540 C (Total Dissolved Solids Dried at 180°C) and Standard Methods 2540 D (Total Suspended Solids at 103-105°C). You can now easily differentiate the wrinkle side from the screen side of the filter, since we've made the wrinkle side visibly different. There is no guesswork for you! Now everyone can clearly see and easily determine which side needs to face up to ensure compliance.

These 1.5 µm binder-free, fast flowing, fine porosity borosilicate glass microfiber filters have been optimised to eliminate pin holing and minimize fibre shedding, two quality issues known to affect other brands of TSS filters. ULTRASep™ TSS Filters are readily available in the most popular sizes used in a wide variety of CoorsTek chemical-porcelain labware including Bitumen, Buchner, Gooch, Hirsch, and many other popular filter holders.

# eVol® hand-held automated analytical syringe

eVol® is the coupling of two precision devices:

a digitally controlled electronic drive and an XCHANGE® enabled analytical syringe.

The result is a digitally controlled positive displacement dispensing system that is programmable to reproducibly and accurately perform a wide variety of liquid handling procedures.

eVol® will improve your laboratory workflow and reporting confidence in many ways.

### Key benefits

- The programmable digital drive means liquid handling procedures are user independent allowing more efficient workflow scheduling and a reduction in the re-analysis of incorrectly processed or false positive samples.
- XCHANGE® analytical syringes are easily and quickly changed allowing them to be dedicated to individual liquids to prevent possible cross-contamination of reagents.

### Precise user-independent dispensing

Unlike air-displacement devices, such as pipettors, eVol® is the perfect solution for accurately aspirating and dispensing both aqueous and non-aqueous liquids.

eVol® features a familiar Touch Wheel user interface and a full-color screen. The clever menu allows all the functions to be accessed logically and quickly. The programming functions are intuitive and include help screens and prompts.

### World's first user calibrated analytical syringe

To comply with your stringent laboratory standards (e.g. GLP, GMP, FDA) eVol® is easily calibrated to ensure accurate dispensing at all times. The gravimetric calibration procedure is simple, intuitive and can be performed at appropriate intervals. Calibration factors can be stored for up to ten XCHANGE® syringes and are quickly loaded when the syringe is changed.

### Typical applications for eVol® include

- Preparation of calibration standards
- Addition of internal standards
- Precise dispensing of non-aqueous liquids
- Sample dilution

Only three XCHANGE® syringes are required to dispense liquid volumes covering the range from 200 nL to 500 µL.

### eVol® NMR Edition

eVol® NMR Edition is the world's first electronic syringe for NMR capillaries. It has been designed for the specific needs of NMR:

- Small sample quantities
- Requirement for very high levels of accuracy and reproducibility
- Alternative to high cost consumables
- Specialist samples and solvents

eVol® NMR Edition allows accurate manipulation of small volumes of NMR samples enabling dilution directly in the analysis tube - even in tubes with the smallest internal diameters.

eVol® facilitates in-tube sample mixing and enables recovery of precious samples allowing them to be stored in alternative vessels (such as inexpensive vials) rather than being left in valuable tubes. These tubes can now be emptied using eVol®, for washing and re-use.

eVol® benefits in NMR

- Facilitates small volume manipulation
- Operator independent accuracy, precision and reliability
- Increased speed of sample processing

## Introduction

### Picograde® solvents for residue analysis

Picograde® solvents form the heart of the LGC Standards solvent range. Each batch undergoes rigorous testing in order to meet the demanding requirements of organic trace analysis every time.

Environmental analysts are now expected to detect trace levels of an increasingly wide range of organic environmental contaminants including pesticides, PAHs, PCBs, PCDDs/PCDFs etc. with the highest possible accuracy. Consequently even the lowest levels of impurity in the solvent can affect the precision of analytical results. Picograde® solvents are specifically tailored to this application.

Carefully selected raw materials are chemically pre-treated and then fractionated in glass in the absence of air. Distillation and filling are similarly carried out in air free conditions. The glass bottles are sterile and dust free and are rinsed with the appropriate solvent prior to filling. Caps used to seal the bottles are subjected to the same stringent cleaning processes. The specification of the solvent includes the determination of water content, residue on evaporation and a comprehensive gas chromatographic analysis.

To confirm the absence of contaminants samples of the solvent are concentrated to varying degrees and then analysed by gas chromatography. Flame ionisation and electron capture detectors (ECD) are used for the quantification of the contaminants. The specification of the Picograde® solvent guarantees that no signal due to contamination will be larger than the internal standard peak (10 pg/mL heptachlor-epoxide) in the retention time window from 1,4-dichlorobenzene to decachlorobiphenyl. The very high specification of the Picograde® solvents allows them to be used for residue analysis of trace quantities of organic contaminants right down to ppb and ppt levels.

### Optigrade® - High purity solvents for HPLC

High performance liquid chromatography is now an essential analytical tool especially in the areas of research and development, pharmaceutical quality control and analysis in the food and environmental sectors. This technique demands the highest quality solvents to allow reproducible separations. The basic requirements include a high UV-transmission factor, low particle levels, slight acidity and alkalinity coupled with low levels of water and other non-volatile components. In addition there must be consistency between batches.

Solvents for isocratic analytical HPLC together with gradient grade quality solvents are included in the HPLC range. Gradient grade has the highest purity and is specially designed for use with gradient elution HPLC using reversed phase materials and UV or fluorescence detection. Quality assurance procedures allow LGC Standards to offer a consistently premium quality product. Each batch is checked to make sure that the solvent has the required high level of UV-transmission in the wavelength range 190-350 nm.

#### Solvents for LC/MS

The presence of alkali and alkaline earth metals in the mobile phase when using LC/MS can make the interpretation of the mass spectrum very difficult. LGC Standards offers solvents designed for this technique with extremely low levels of these metals, at 0.1 ppm and less.

#### Solvents for Ultra HPLC (UHPLC)

ULTRA HPLC (UHPLC) requires solvents of superior quality. A new range of high purity Optigrade® solvents from LGC Standards has been designed to allow high resolution and sensitivity. Such Ultra HPLC solvents combine the highest specification for: UV, low gradient shift, minimal peak impurities and lowest ionic background for MS detection. All Ultra HPLC solvents are micro filtered at 0.1 µm, have a residue following evaporation of max 1 ppm and are packed under inert gas for improved shelf life. Also available are selected buffers for mobile phase preparation and several blends of water and acetonitrile with formic acid, acetic acid and trifluoroacetic acid are offered.

### Specialist solvents

- **Solvents for VOCs and aromatic hydrocarbons**

It has become increasingly necessary to be able to determine a range of organic compounds in environmental samples including volatile organic compounds (VOCs) and BTEX-aromatics. Various extraction techniques are used for the separation and concentration of organic trace constituents from the sample matrix and it is essential to use solvents with very low levels of contamination. LGC Standards can provide the solvents to meet these exacting requirements.

- **Solvents for GC headspace techniques**

Analysis of volatile organic impurities using the GC headspace technique has become an important quality control tool in pharmaceutical and food related industries. The International Conference on Harmonization of technical requirements for registration of pharmaceuticals for Human use (ICH) has issued recommendations concerning the safe levels of residual solvents in pharmaceutical compounds. These solvents are divided into 3 classes according to their toxicity. Limit values of residual solvents in pharmaceutical products are specified by the United States and European Pharmacopeia. The quality of the solvent used to dissolve the sample is of prime importance. It must be of the highest purity and show virtually no background signal with both polar and non polar GC capillary columns. The new headspace solvents are high boiling point solvents, specifically developed, analysed and packed for the headspace analysis of volatile solvent impurities.

- **Solvents for the analysis of nitrosamines**

When extracting trace levels of nitrosamines in samples it is important to use a solvent that is free of nitrosamine contamination. For this application LGC Standards has solvents with a maximum level of 0.1ppb of specific nitrosamines.

- **Solvents for the tobacco industry**

### High purity acids

LGC Standards offers the most frequently used mineral acids for trace analysis: hydrochloric acid, nitric acid, hydrofluoric acid, sulfuric acid, perchloric acid and acetic acid. These are produced by sub-boiling distillation of very pure starting materials. This purification results in most metallic impurities reduced to (or below) ppb ranges. The acids are delivered in special bottles (long-term leached borosilicate glass or modified HDPE) which ensure minimum contamination of the acid from the material of the bottle.

Important note: Element concentrations are at the point of bottling. Concentrations of some elements may increase due to the storage container.

## The UK Chemical Calibration Facility (UKCCF) at LGC

The UK Chemical Calibration Facility (UKCCF) at LGC has been set up to help organisations involved in chemical analysis make accurate and traceable measurements.

LGC's internationally recognised analytical scientists with a unique combination of state-of-the-art chromatography and mass spectrometry methods, are able to offer a range of highly specialist calibration and measurement services and advice to:

- Calibration service providers
- Proficiency testing scheme organisers
- Reference material producers
- Standards and regulatory bodies
- Quality laboratories.

Traceability

The facility is part of the UK's designated National Measurement Institute for chemical and bioanalytical measurements.

## The UKCCF provides advice and solutions to a wide range of quality and measurement issues:

- Confirmation of product specification against standards and regulations;
- Independent verification of in-house quality control materials;
- Compliance with quality standards such as ISO/IEC 17025, GLP/GMP, ISO 9001, ISO 15189;
- Dispute resolution e.g. product specification and quality;
- Problem solving e.g. reliable identification of measurement bias;
- Credibility and confidence to compete in the international market place.

98140 Maize seed .....	169	Acrolein-DNPH .....	504	2-Aminobenzimidazole .....	316
Abamectin .....	315	Acrylamide (1,2,3-13C3,99%) .....	312, 663	2-Aminobiphenyl .....	471
L-Abrine .....	287, 288	Acrylamide (2,3,3-D3,98%) .....	663	4-Aminobiphenyl .....	471, 472
ABS resin - Cd, Cr, Hg, Pb .....	259, 260	Acrylamide .....	312, 471, 663, 770	Aminocarb .....	316
Acenaphthene (13C6,99%) .....	421, 649, 668, 673	Acrylonitrile (13C3,99%) .....	673	6-Aminochrysene .....	472
Acenaphthene (D10,98%) .....	421, 650, 668	Acrylonitrile (D3,98%) .....	673	2-Amino-4,6-dinitrotoluene .....	461, 797
Acenaphthene .....	421, 651, 668, 673	Acrylonitrile .....	471, 770	4-Amino-2,6-dinitrotoluene .....	461, 797
Acenaphthene-D10 .....	421, 738	Acrylonitrile-Butadiene-Styrene-Copolymerisate (ABS) .....	261	Aminoethoxyvinyl glycine hydrochloride ..	316
Acenaphthylene (13C6,99%) .....	421, 649, 673	S-Adenosyl-L-methionine chloride .....	288	2-Aminoflucendazole .....	438
Acenaphthylene (D8,98%) .....	421, 650	S-Adenosyl-L-methionine iodide .....	288	1-Aminohydantoin hydrochloride (5,5-D2,98%) .....	438, 663
Acenaphthylene .....	421, 651, 673	S-Adenosyl-L-methionine p-toluenesulfonate .....	288	1-Aminohydantoin hydrochloride .....	438, 663
Acephate (D6,98%) .....	315, 685, 687	S-Adenosyl-L-methionine p-toluenesulfonate .....	288	Aminomethylphosphonic acid (13C,99%, 15N,98%, methylene-D2,98%) ..	472, 685, 700
Acephate .....	315, 685, 687	Adipic acid .....	302	2-Aminonaphthalene (ring-D7,98%) .....	673
Acepromazine-d6 hydrochloride .....	438	Aflatoxin .....	189, 308	1-Amino-4-nitronaphthalene .....	472
Acequinocyl .....	438	Aflatoxin B1 (U-13C17) .....	303	4-Amino-2-nitrophenol .....	472
Acesulfame potassium .....	303	Aflatoxin B1 .....	303	3-Amino-2-oxazolidone .....	438, 663
Acetaldehyde-DNPH .....	503	Aflatoxin B2 (U-13C17) .....	304	2-Aminophenol .....	316
2-Acetamido-2-deoxy-D-galactopyranose ..	283	Aflatoxin B2 .....	303, 304	3-Aminophenol .....	316
2-Acetamidonaphthalene .....	471	Aflatoxin G1 (U-13C17) .....	304	4-Aminophenol .....	316
2-Acetamido-5-nitrothiazole .....	438	Aflatoxin G1 .....	304	4-Aminophenyl-1-thio-beta-D-galactopyranoside .....	283
Acetaminophen (acetyl-13C2,99%, 15N,98%) .....	438, 662	Aflatoxin G2 .....	304	1-Amino-2-propanol (D9,98%) .....	673
Acetaminophen .....	438, 662	Aflatoxin M1 .....	304	2-Aminopyridine .....	316
Acetaminophen-D4 (Paracetamol) .....	444	Aflatoxin Mix .....	306	4-Aminopyridine .....	316
Acetamidrid .....	315	Agroclavine .....	304	Amitraz .....	316
Acetanilide - Carbon, hydrogen, nitrogen and oxygen .....	809	Aklomid .....	438	Amitriptyline HCl (D6,98%) .....	439, 662, 663
Acetate .....	539	Alachlor (ring-13C6,99%) .....	315, 668, 687	Amitriptyline HCl .....	438, 662, 663
Acetic acid .....	538, 894	Alachlor acetylcysteine adduct (ring-13C6,99%) .....	315, 687	Amitrole .....	316
Acetochlor .....	315	Alachlor ESA sodium salt .....	315	Ammelide (ring-13C3,99%) .....	663
Acetochlor ESA sodium salt .....	315	Alachlor OA .....	315	Ammelide .....	663
Acetochlor OA .....	315	D-Alanine .....	288	Ammeline .....	663, 687, 689
Acetonchloroform .....	315	DL-Alanine .....	288	Ammonia solution .....	538, 899
Acetone (D6,99,9%) .....	673	L-Alanine .....	288	Ammonium .....	541
Acetone .....	312, 471	Alanycarb .....	315	Ammoniumacetate UHPLC-MS Optigrade® .....	893
Acetone-DNPH .....	503	Albendazole-sulfone .....	438	Ammonium chloride, 99.999% .....	817
Acetone HPLC Optigrade® .....	894	Albendazole-sulfoxide .....	438	Ammonium digydrogen phosphate, 99.999% .....	817
Acetonitrile .....	471, 770	Albizzin .....	288	Ammonium hexachloroosmate, 99.99% ..	817
Acetonitrile 0.1 % acetic acid ULC-MS Optigrade® .....	897	Alcohols Kit .....	469	Ammonium hexachlororhodate, 99.995% ..	817
Acetonitrile 0.1 % trifluoroacetic acid UHPLC-MS Optigrade® .....	898	Aldehyde/Ketone-DNPH .....	505, 506	Ammonium hexachlororuthenate(IV), 99.99% .....	817, 818
Acetonitrile DNA. max. 0.001% water .....	898	Aldehydes .....	503	Ammonium hexafluorosilicate, 99.999% ..	818
Acetonitrile DNA. max. 0.003% water .....	898	Aldicarb .....	315	Ammonium hexafluorotitanate, 99.99% ..	818
Acetonitrile for LC-MS Optigrade® .....	896	Aldicarb-sulfone .....	316	Ammonium hydrogen fluoride, 99.999% ..	818
Acetonitrile HPLC Optigrade® .....	895, 896	Aldicarb-sulfoxide .....	316	Ammonium metavanadate, 99.999% .....	818
Acetonitrile HPLC Optigrade® Gradient Grade .....	895	Aldrin (13C12,99%) .....	316, 668, 673, 682, 683, 687	Ammonium molybdate, 99.999% .....	818
Acetonitrile HPLC Optigrade® Super Gradient Grade .....	895	Aldrin (as Cl) .....	803	Ammonium nitrate, 99.999% .....	818
Acetonitrile UHPLC-MS Optigrade® .....	896	Aldrin .....	316, 673, 682, 683, 687	Ammonium sulfate (as N) .....	802
Acetophenone .....	471	n-Alkanes Mixtures .....	417	Ammonium sulfate, 99.999% .....	818
Acetophenone-DNPH .....	503	Allergen detection - whole egg .....	188	Ammonium sulfate - Nitrogen-15 .....	816
2-Acetylaminofluorene .....	471	Allethrin .....	316	Ammonium tetrachloroplatinate(II), 99.99% .....	818
N-Acetyl-L-arginine .....	288	Allidochlor .....	316	Ammonium tetrathiomolybdate, 99.995% ..	818
N-Acetyl-L-cysteine .....	288	D-(+)-Allose .....	283	Amnesic shellfish poisons (ASP) .....	311
3-Acetyl-deoxynivalenol .....	303	DL-Allothreonine .....	288	Amoxicillin 3H2O (phenyl-13C6,99%) .....	663
15-Acetyl-deoxynivalenol .....	303	Alloxanthin .....	287	Amoxillin trihydrate .....	439
3-Acetyl-deoxynivalenol (13C17) .....	303	Alloxydim-sodium .....	316	AMOZ .....	439, 443, 664
3-Acetyl-deoxynivalenol .....	303	Allura Red AC .....	300	Amphotericin B trihydrate .....	439
15-Acetyl-deoxynivalenol .....	303	Allyl alcohol .....	316, 471	Ampicillin trihydrate .....	439
N-Acetyl-DL-O-fluorophenylalanine .....	288	Allyl chloride .....	471	Amprolium hydrochloride .....	439
N-Acetyl-beta-D-galactosamine .....	283	Allyl iso-thiocyanate .....	316	n-Amyl acetate .....	472
N-Acetyl-D-glucosamine .....	283	alpha-Cypermethrin .....	326	t-Amyl methyl ether in gasoline .....	232
N-Acetyl-DL-leucine .....	288	Alpha quartz .....	130, 134	Amylopectin .....	283
N-Acetyl-L-glutamine .....	288	Altrenogest .....	438	5-alpha-Androstane .....	472
N-Acetyl-D-mannosamine .....	283	D-Altrose .....	283	5a-Androstan-17β-ol-3-one .....	439
N-Acetyl-DL-methionine .....	288	Aluminium 2-ethylhexanoate - Aluminium ..	812	Androstanolone 17-benzoate .....	439
N-Acetyl-L-glutamine .....	288	Aluminum .....	510, 522, 523, 527	Androstenedione .....	439
N-Acetyl-D-mannosamine .....	283	Aluminum chloride hexahydrate, 99.999% ..	817	cis-Androsterone .....	439
N-Acetyl-DL-methionine .....	288	Aluminum nitrate nonahydrate, 99.999% ..	817	1,4-Anhydroerythritol .....	283
N-Acetylneuraminic acid .....	283	Aluminum oxide, 99.999% .....	817	1,6-Anhydro-beta-d-glucose (Levoglucozan) (U-13C6,98%) .....	663
N-Acetyl-serotonin .....	288	Aluminum shot, 99.9995% .....	817	1,6-Anhydro-beta-d-glucose .....	663
N-Acetyl-L-tyrosine .....	288	Amaranth .....	300	Anhydrotetracycline hydrochloride .....	439
N-Acetyl-L-tyrosine-ethylester .....	288	Ametryn .....	316	Anilazine .....	316
N-Acetyl-DL-valine .....	288	Amidosulfuron .....	316	Aniline (13C6,99%) .....	673
Acibenzolar-S-methyl .....	315	Amines kit .....	470, 471	Aniline (D7,98%) .....	673
Acid casein .....	140	5-Amino-2-methyl-3-nitrobenzamide .....	438	Aniline (ring-D5,98%) .....	673
Acid Orange 7 .....	301	3-Amino-2-methyl-5-nitrobenzamide .....	438		
Acid Red 33 .....	301	Amino acids kit .....	300, 470		
Acids Kit .....	468

Di-n-butyl phthalate (ring-D4,98%)	664, 669, 676	trans-Dichlorodiammineplatinum(II), 99.99%	819	2,5-Dichloro-o-terphenyl	405
Di-n-butyl phthalate (ring-D4,98%)	676	1,6-Dichlorodibenzo-p-dioxin	552	1,2-Dichloro-1,1,2,2-tetrafluoroethane	482, 483
Di-n-butyl phthalate	479	2,3-Dichlorodibenzo-p-dioxin (13C12,99%)	551	alpha,2-Dichlorotoluene	483
Dibutyl phthalate	330, 479	2,3-Dichlorodibenzo-p-dioxin	410, 552	alpha,3-Dichlorotoluene	483
Dibutyltin bis (2-ethylhexanoate) - Tin	812	2,7/2,8-Dichlorodibenzo-p-dioxin isomer pair	551	alpha,4-Dichlorotoluene	483
Dibutyltin dichloride	502	2,7-Dichlorodibenzo-p-dioxin (13C12,99%)	551	2,3-Dichlorotoluene	483
Dibutylsuccinate	330	2,7-Dichlorodibenzo-p-dioxin	551	2,4-Dichlorotoluene	483
Dicamba	330	2,7-Dichlorodibenzo-p-dioxin	410	2,5-Dichlorotoluene	483
Dicamba methyl ester	330	2,8-Dichlorodibenzo-p-dioxin	410	2,6-Dichlorotoluene	483
Dicapthon	330	2,4-Dichlorodibenzofuran (13C12,99%)	552	3,4-Dichlorotoluene	483
Dichlobenil	330	2,4-Dichlorodibenzofuran	411, 553	alpha,alpha-Dichlorotoluene	331
Dichlofenthion	330	2,6-Dichlorodibenzofuran	411, 553	3,4-Dichloro-3',4',5'-tribromobiphenyl (13C12,99%)	635
Dichlofluamid	330	2,8-Dichlorodibenzofuran (13C12,99%)	552	3,4-Dichloro-3',4',5'-tribromobiphenyl	635
Dichlone	330	2,8-Dichlorodibenzofuran	411, 553	5,6-Dichlorovanillin	676
Dichloran	330, 775	Dichlorodifluoromethane	481	Dichlorprop (ring-13C6,99%)	332, 689
Dichlorane (ring-13C6,99%)	330, 684, 689	2,4-Dichlorodiphenyl ether	481, 778	Dichlorprop	331, 689
Dichloromethane HPLC Optigrade® 901, 902		2,4'-Dichlorodiphenyl ether	481	Dichlorprop-methyl ester	332
Dichloromid	330	4,4'-Dichlorodiphenyl ether	481	Dichlorprop-P	332
Dichloroacetic acid	330, 480	1,1-Dichloroethane (2,2,2-D3,98%)	676	Dichlorvos (dimethyl-D6,98%)	332, 685, 689
Dichloroacetonitrile	480	1,1-Dichloroethane	481	Dichlorvos	332, 685, 689
2,3-Dichloroaniline	330, 480	1,2-Dichloroethane	481	DiClazuril	440
2,4-Dichloroaniline	330, 480	1,2-Dichloroethane-d4	481, 755, 756	DiClobutrazol	330
2,5-Dichloroaniline	330, 480	1,2-Dichloroethane (D4,99%)	676	Diclofop-methyl	332
2,6-Dichloroaniline	331, 480	1,1-Dichloroethene	481	Diclosulam	332
3,4-Dichloroaniline (13C6,99%)	676	cis-1,2-Dichloroethene	481	Dicloxacillin sodium salt hydrate	440
3,4-Dichloroaniline	331, 480	trans-1,2-Dichloroethene	481	Dicofol	332
3,5-Dichloroaniline	331, 480	1,1-Dichloroethylene (2,2-D2,98%)	676	Dicrotophos	332
alpha,4-Dichloroanisole	480	1,1-Dichloroethylene (random-13C,99%)	671	Dicyclanil	332
2,3-Dichloroanisole	480	1,1-Dichloroethylene	671	Dicyclohexyl phthalate (ring-1,2-13C2,99%,dicarboxyl-13C2,99%)	664
2,4-Dichloroanisole	480	1,2-Dichloroethylene (1,2-D2,98%)	676	Dicyclohexyl phthalate	483, 664
2,5-Dichloroanisole	480	1,2-Dichloroethylene (13C1,99%)	671	Didymium glass - UV wavelength	855
2,6-Dichloroanisole	480	1,2-Dichloroethylene cis/trans mix	671	Dieldrin (13C12,99%)	332, 669, 676, 683, 684, 689
3,4-Dichloroanisole	480	1,1-Dichloro-1-fluoroethane	481	Dieldrin	332, 669, 676, 683, 684, 689
3,5-Dichloroanisole	480	Dichlorofluoromethane	481	Dielectric constant	867
Dichlorobenzamid	331	Dichloromethane nitrosamine-free	902	Dienestrol	440
2,6-Dichlorobenzamide	331	Dichloromethane Picograde® for residue analysis (stabilised with amylene)	902	Dienochlor	332
1,2-Dichlorobenzene (13C6,99%)	667	1,2-Dichloronaphthalene	406, 653	Diesel fuel #2 (25% weathered)	437
1,2-Dichlorobenzene (D4,98%)	676	1,4-Dichloronaphthalene	406, 482, 653	Diesel fuel #2 (50% weathered)	437
1,2-Dichlorobenzene	331, 407, 480, 667	1,5-Dichloronaphthalene	406, 482, 653	Diesel fuel #2 (75% weathered)	437
1,2-Dichlorobenzene-d4	480, 729	1,8-Dichloronaphthalene	406, 653	Diesel fuel #2 (unweathered)	436
1,3-Dichlorobenzene (13C6,99%)	667, 676	2,3-Dichloronaphthalene	406, 482, 653	Diesel fuel	435, 436, 477
1,3-Dichlorobenzene	331, 407, 480, 667	2,4-Dichloro-1-naphthol	482	Diesel fuel - Sulfur	224, 230
1,4-Dichlorobenzene (13C6,99%)	676	2,3-Dichloronitrobenzene	331	Dieselfuel-Sulfur	224
1,4-Dichlorobenzene (D4,98%)	676	2,4-Dichloronitrobenzene	462	Diesel oil #2	435, 483
1,4-Dichlorobenzene	331, 407, 480	2,5-Dichloronitrobenzene	331	Diesel oil	434
1,4-Dichlorobenzene-d4	480	3,4-Dichloronitrobenzene	331	Diesel particulate	127
3,3'-Dichlorobenzidine (ring-D6,98%)	676	3,5-Dichloronitrobenzene	331	Diesel particulate matter	127
3,3'-Dichlorobenzidine	480	Dichlorophen	331	Diesel Range Organics	418
3,3'-Dichlorobenzidine-d6	480	2,3-Dichlorophenol	482	Diesel - Sulfur	227
3,3'-Dichlorobenzidine dihydrochloride	480	2,4-Dichlorophenol (13C6,99%)	671	Dietary supplement	143
2,3-Dichlorobenzoic acid	480	2,4-Dichlorophenol (D4,98%)	669, 676	Diet composite	183
2,4-Dichlorobenzoic acid	331, 480	2,4-Dichlorophenol (ring-D3,98%)	667, 676	Diethofencar	332
2,5-Dichlorobenzoic acid	331, 480	2,4-Dichlorophenol	331, 482, 667	Diethofencarb	332
2,6-Dichlorobenzoic acid	331, 480	Dichlorofluoromethane	482	2-Diethylaminoethanethiol	483
3,4-Dichlorobenzoic acid	480	2,5-Dichlorophenol (13C6,99%)	667	2,6-Diethylaniline	332
3,5-Dichlorobenzoic acid	480, 741	2,5-Dichlorophenol	331, 482	1,2-Diethylbenzene	483
4,4'-Dichlorobenzophenone	331	2,6-Dichlorophenol	331, 482	1,3-Diethylbenzene	483
2,2'-Dichlorobiphenyl (13C12,99%)	385, 596	3,4-Dichlorophenol	482	1,4-Diethylbenzene	483
2,2'-Dichlorobiphenyl	385, 598, 600				
2,3-Dichlorobiphenyl	385, 600				

## Product index

Diethylcarbamazine citrate .....	440	O,O-Dimethyl dithiophosphate sodium salt .....	333, 689, 700	2,6-Dinitrotoluene (methyl-D3,98%) .....	672, 677
Diethylene glycol (D8,98%) .....	663	Dimethyl endothall .....	333, 738	2,6-Dinitrotoluene .....	462, 485, 672, 797
Diethylene glycol .....	663	2,4-D-methyl ester .....	327	3,4-Dinitrotoluene .....	462, 736, 777, 797
Diethyl ether (D10,99%) .....	676	1,2-Dimethyl-3-ethylbenzene .....	484	3,5-Dinitrotoluene .....	462
Diethyl ether .....	483	1,2-Dimethyl-4-ethylbenzene .....	484	Dinobuton .....	334
Diethyl ether HPLC Optigrade® .....	902, 903	1,3-Dimethyl-4-ethylbenzene .....	484	Dinocap (ring-13C6,99%) .....	334, 689
Diethyl ether Picograde® for residue analysis .....	903	1,3-Dimethyl-5-ethylbenzene .....	484	Dinocap .....	334
O,O-Diethyl hydrogen dithiophosphate... ..	332, 483, 700	1,4-Dimethyl-2-ethylbenzene .....	484	Dinoseb .....	334
Diethyl hydrogen phosphate ....	332, 483, 700	4-(1,4-Dimethyl-1-ethylpentyl) phenol .....	665	Dinoseb acetate .....	334
O,O-Diethyl hydrogen thiophosphate.....	332, 483, 700	4-(1,3-Dimethyl-1-ethylpentyl) phenol .....	665	Dinoseb methyl ether .....	334
O,O-Diethyl hydrogen thiophosphate potassium salt (diethyl-D10,98%).....	332, 483, 685, 689, 700	4-(1,3-Dimethyl-1-ethylpentyl)phenol (ring-13C6,99%).....	665	Dinoterb .....	334
Diethyl methylphosphonate .....	484	4-(Dimethyl-1-ethylpentyl) phenol .....	665	Dinoterb acetate .....	334
Diethyl phthalate (ring-D4,98%).....	664, 669, 676	N,N-Dimethylformamide (carbonyl-13C,99%) .....	677	Diocetyl maleate .....	485
Diethyl phthalate .....	332, 483, 664	2,4-Dimethylformanilide.....	333	Di-n-octyl phthalate (ring-D4,98%)... ..	664, 677
Diethylstilbestrol (cis/trans mix) (ring-3,3',5,5'-diethyl-1,1,1',1'-D8,98%).....	441, 661	Dimethyl hydrogen phosphate .....	333, 484, 701	Di-n-octyl phthalate .....	485, 664, 677
Diethylstilbestrol (cis/trans mix) .....	441, 661	1,3-Dimethyl-2-imidazolidinone (DMI) Headspace Grade .....	905	Diocetyl phthalate .....	485
Diethylstilbestrol .....	440, 441, 661	1,6-Dimethylnaphthalene (D12,98%).....	650	Diocytlin dichloride .....	502
N,N-Diethyl-m-toluamide (DEET) (dimethyl-D6,98%).....	329, 661, 689	1,6-Dimethylnaphthalene .....	652	Diofenolan .....	334
N,N-Diethyl-m-toluamide (DEET) ...	329, 661, 689	1,8-Dimethylnaphthalene (D12,98%).....	650	Dioxacarb .....	334
Difenacoum .....	332	1,8-Dimethylnaphthalene .....	652	1,4-Dioxane HPLC Optigrade® .....	905
Difenoconazole .....	332	2,6-Dimethylnaphthalene (D12,98%).....	650	1,4-Dioxane (p-Dioxane) (D8,98%).....	677
Difenoxuron .....	332	2,6-Dimethylnaphthalene .....	652	1,4-Dioxane (D8,99%) .....	677
Difenoquat-methyl sulfate .....	332	1,3-Dimethyl-2-nitrobenzene.....	484, 722	1,4-Dioxane .....	485, 677
Diflovidazin .....	332	Dimethyl-p-nitrophenylphosphate .....	333	Dioxathion .....	334
Difloxacin-d3 hydrochloride .....	441	Dimethyl 5-nitro-iso-phthalate.....	333	Di-n-pentyl phthalate (ring-1,2-13C2,99%, dicarboxyl-13C2,99%) .....	664, 669
Difloxacin hydrochloride.....	441	alpha,alpha-Dimethylphenethylamine.....	484	Di-n-pentyl phthalate .....	664, 669
Diflubenzuron.....	332, 333	2,3-Dimethylphenol .....	333	Diphenamid.....	334
Diflufenican .....	333	2,4-Dimethylphenol (ring-D3,98%) .....	677	Diphenylamine (diphenyl-D10,98%) .....	677
Diflufenzopyr-sodium .....	333	2,4-Dimethylphenol .....	333, 484	Diphenylamine .....	334, 462, 485
1,4-Difluorobenzene .....	483, 756	2,5-Dimethylphenol .....	333	9,10-Diphenylanthracene.....	485
2,2'-Difluorobiphenyl .....	483, 761	2,6-Dimethylphenol .....	333	1,2-Diphenylethane .....	426
4,4'-Difluorobiphenyl .....	483, 738	3,4-Dimethylphenol.....	333	Diphenyl ether (13C12,99%).....	637, 677
D-(+)-Digitoxose .....	284	3,5-Dimethylphenol .....	333	Diphenyl ether (D10,98%).....	677
Diheptylin dichloride.....	502	Dimethyl phthalate (ring-D4,98%)... ..	664, 677	Diphenyl ether .....	485
Di-n-hexyl phthalate (ring-1,2-13C2,99%, dicarboxyl-13C2,99%) .....	664, 669	Dimethyl phthalate ...	333, 334, 484, 664, 770	Diphenylether .....	638
Di-n-hexyl phthalate .....	664, 669	Dimethylsulfoxide Headspace Grade .....	905	5,5-Diphenylhydantoin (2-13C, 99%, 1,3-15N2, 98%).....	441, 662
6,13-Dihydrodibenzo(b,i)phenazine .....	483	Dimethyl terephthalate .....	484	5,5-Diphenylhydantoin .....	441, 662
1,2-Dihydronaphthalene .....	483	Dimethyl tetrabromobisphenol A.....	639	1,2-Diphenylhydrazine (diphenyl-D10,98%) .....	677
beta-DL-3-(3,4-Dihydroxyphenyl)-alanine .....	289	Dimethyltin dichloride.....	334, 502	1,2-Diphenylhydrazine .....	485

Ethanol HPLC Optigrade®	906	Fenaminosulf	338	Flubendiamide	340
Ethanol in water	185	Fenamiphos	338	Flubenzimine	340
Ethephon	337	Fenamiphos-sulfone	338	Fluchloralin	340
Ethidimuron	337	Fenamiphos-sulfoxide	338	Flucycloxuron	340
17 $\alpha$ -Ethinylestradiol	441	Fenarimol	338	Flucythrinate	340
Ethiofencarb	337	Fenazaflor	338	Fludioxonil	340
Ethiofencarb-sulfone	337	Fenazacquin	338	Flufenacet	340
Ethiofencarb-sulfoxide	337	Fenazox	338	Flufenacet ESA sodium salt	340
Ethiolate	337	Fenbendazole	441	Flufenacet OA	340
Ethion	337	Fenbendazole-d3	441	Flufenoxuron	340
Ethiprole	337	Fenbendazole-sulfone	441	Flumequine	340
Ethirimol	337	Fenbuconazole	338	Flumethrin	340
Ethisterone	441	Fenbutatin oxide	338	Flumetralin	340
Ethofumesate	337	Fenchlorazol-ethyl	338	Flumioxazin	340
Ethopabat	441	Fenchlorphos	338	Flunixin	441
Ethoprop	337	Fenclorim	338	Flunixin-D3	441
Ethoprophos	337	Fenfuram	338	Fluometuron	340
2-Ethoxyethanol HPLC Optigrade®	906	Fenhexamid	338	Fluopicolide	340
2-Ethoxyethyl acetate	486	Fenitrothion (O,O-dimethyl-D6,98%)	338, 685, 689	Fluoranthene (13C6,99%)	426, 649, 677
Ethoxyquin	337	Fenitrothion	338	Fluoranthene (D10,98%)	426, 650, 677
Ethoxysulfuron	337	Fenobucarb	338	Fluoranthene	426, 652, 677
Ethychnozate	337	Fenoprop	339	Fluoranthene, 3-nitro	426
4-(1-Ethyl-1-methylhexyl)phenol	486	Fenoprop methyl ester	339	Fluoranthene, 1,2,3,4-tetrahydro	426
4-(2-Ethyl-1-methylhexyl)phenol	486	Fenoxanil	339	Fluorene (13C6,99%)	426, 649, 677
Ethylacetate	312, 486	Fenoxaprop	339	Fluorene (D10,98%)	426, 650, 651, 677
Ethylacetate for LC-MS Optigrade®	906, 907	Fenoxaprop-ethyl	339	Fluorene	426, 652, 677
Ethylacetate HPLC Optigrade®	906	Fenoxaprop-P	339	Fluorene, 1-methyl	426
Ethylacetate Picograde® for residue analysis	907	Fenoxaprop-P-ethyl	339	9-Fluorenone	426
Ethyl alcohol	486	Fenoxycarb	339	Fluorescence spectroscopy	851, 852
Ethylbenzene (D10,98%)	677	Fenpiclonil	339	Fluoride	540
Ethylbenzene (D10,99%)	650, 677	Fenpropathrin	339	Fluoroacetic acid sodium salt	340
Ethylbenzene (ethyl-D5,98%)	677	Fenpropidin	339	4-Fluoroaniline	486, 761
Ethylbenzene	486	Fenpropimorph	339	Fluorobenzene	486, 718, 729, 756
Ethylbenzene-D10	486, 756	Fenpyroximate	339	2-Fluorobiphenyl	486, 778
Ethyl t-butyl ether in gasoline	232	Fenson	339	Fluorodifen	340
Ethyl centralite	462	Fensulfothion	339	Fluoroglycofen-ethyl	340
Ethylene glycol	486	Fenthion	339	1-Fluoronaphthalene	486, 761, 778
Ethylene thiourea	337, 486	Fenthion-sulfone	339	2-Fluoronaphthalene	486, 487, 761
2-Ethylhexyl diphenyl phosphate	337	Fenthion-sulfoxide	339	2-Fluorophenol	487, 746, 761, 771
2-Ethylhexyl hydrogen methylphosphonate	486	Fentin-acetate	339	4-Fluoro-3-phenoxybenzoic acid (13C6,99%)	341, 686, 689
Ethyl hydrogen dimethylamidophosphate sodium salt (13C4,99%)	685, 701	Fentin-chloride	339	4-Fluoro-3-phenoxybenzoic acid	341, 686, 689
Ethyl hydrogen dimethylamidophosphate sodium salt	337, 486, 685, 701	Fentin-hydroxide	339	Fluorspar	207
Ethyl hydrogen methylphosphonate (ethyl-D5,98%)	486, 685, 701	Fentrazamid	339	Fluotrimazole	341
Ethyl-4-hydroxybenzoate	301, 486	Fenuron	339	Fluoxastrobin	341
4,6-O-Ethylidene-alpha-D-glucopyranoside	284	Fenvalerate	339, 340	Fluoxetine hydrochloride	442
Ethyl methacrylate	486	Ferbam	340	Fluquinconazole	341
Ethyl methanesulfonate	486	Fertilizers	201, 202, 208	Flurenol-methyl ester	341
4-(1-Ethyl-1-methylhexyl) phenol	665	Fibronil	340	Fluridone	341
4-(1-Ethyl-1-methylhexyl) phenol (ring-13C6,99%)	665	FID Test Mixture	506	Flurorene	426
Ethyl methylphosphonic acid	337, 486, 701	Filter	882	Fluroxypr	341
2-Ethylphenol	337	Filter media	132, 133, 134	Fluroxypr-1-methylheptylester	341
3-Ethylphenol	337	Finasteride	441	Flurprimidol	341
4-Ethylphenol	337	Fipronil	340	Flurtamone	341
2-Ethyltoluene	486	Fipronil sulfone	340	Flusilazole	341
3-Ethyltoluene	486	Firebrick	206	Flutolanil	340
4-Ethyltoluene	486	Fish	152	Flutriafol	341
Ethinylestradiol (20,21-13C2,99%)	441, 661	Fish flesh	159	tau-Fluvalinate	341
Ethinylestradiol	661	Fish oil	153	Fluxofenim	341
Etofenprox	337	Fish oil - DR CALUX® TEQ	160, 195	Fly ash	124, 126
Etoxazole	337	Fish - Organic contaminants	154, 155, 157, 158, 159, 572, 573, 574	Fly ash - Dioxins and furans	124
Etridiazole	337	Fish otolith	160	Fly ash - Trace elements	124
Etrifos	337	Fish protein - Trace elements	159	Folic acid (Vitamin M)	291
Eugenol	338	Fish - Radioactive isotopes	159	Folpet	341
Europium	513, 524, 528	Flame retardants	409	Fomesafen	341
Evaporated milk	140	Flamprop-isopropyl	340	Fonofos (ring-13C6)	341, 685, 689
Event 3272 maize	168	Flamprop-M-isopropyl	340	Fonofos	341, 685, 689
eVol® - Electronic syringe	885	Flamprop-M-isopropylester	340	Food authenticity	179, 180
Ewes'Goats' curd	138	Flash point	832	Foramsulfuron	341
Explosives	464	Flazasulfuron	340	Forchlorfenuron	341
Famoxadone	338	Fleroxacin	441	Formaldehyde-DNPH	129, 504
Famphur	338	Flint clay	216	Formate	540
Fatty acid methyl esters in 2,2,4-trimethylpentane	299	Flocoumafen (mixture of isomers)	340	Formetanate hydrochloride	341
Febantel	441	Flonicamid	340	Formic acid UHPLC-MS Optigrade®	893
Febantel-d6	441	Florasulam	340	Formothion	341
Feedingstuff - DR CALUX® TEQ	191, 194	Florisil®	892	Fosfomycin sodium	442
Feldspar	205	Florisil® for ISO 9377-2/H53	435, 892	Fosthiazate	341
Fenamidone	338	Fluazifop	340	Foundry coke	250
Fenamidone metabolite	338	Fluazifop-butyl	340	Foundry coke - Sulfur	250
		Fluazifop-methyl	340	Free cyanide	542
		Fluazifop-P-butyl	340	Freezing point	831
		Fluazinam	340	Freon 134	496
		Fluazuron	340	Freon 134A	496
		Flubendazole	441	Fresh cheese	140
		Flubendazole-d3	441	Fresh water sediment	40, 54

Fresh water sediments - PCBs and PBDEs	43	1-Thio-beta-D-glucose sodium salt	285	2,2',3,3',4,5',6-Heptabromodiphenyl ether (BDE-175)	639

Methyl iodide.....	489	Metribuzin .....	349	Monoethyl phthalate (ring-1,2-13C2, dicarboxyl-13C2,99%) .....	665
2-Methylisoborneol (2-methyl-D3,98%) ..	443, 664	Metronidazol .....	443	Monoethyl phthalate.....	665
Methyl isobutyl ketone .....	489	Metronidazole-13C2,15N2.....	443	Monoheptyltin trichloride.....	502
Methyl isobutyl ketone-DNPH.....	504	Metronidazole-OH.....	443	Monoisobutyl phthalate .....	665
Methyl isopropyl ketone-DNPH.....	504	Metsulfuron-methyl .....	349	Monoisobutyl phthalate .....	665
Methyl isothiocyanate.....	348	Mevinphos .....	349	Monoisononyl phthalate (ring-1,2-13C2,99%, dicarboxyl-13C2,99%) .....	665
Methyl-alpha-D-mannopyranoside.....	285	Mexacarbate .....	349	Monoisononyl phthalate .....	665
Methylmercury chloride.....	348	MGK 264.....	349	Monoisopropyl phthalate.....	665
Methyl methacrylate.....	489	MGK 326 .....	349	Monoliformin .....	305
Methyl methanesulfonate.....	489	Microcystin-LR.....	506	Monolinuron .....	350
1-Methylnaphthalene (D10,98%).....	651	Microcystin Mix .....	506	Monomethyl 5-nitro-iso-phthalate .....	350
1-Methylnaphthalene .....	489	Microcystin-RR .....	506	Monomethyl phthalate (ring-1,2-13C2, dicarboxyl-13C2,99%) .....	665
2-Methylnaphthalene (13C6,99%).....	649	Microcystin-YR.....	506	Monomethyl phthalate .....	490, 665
2-Methylnaphthalene (D10,98%).....	651	Microhardness .....	845	Monomethyl phthalate .....	462
2-Methylnaphthalene .....	489, 490, 652	Micropore volume .....	843	1-Mononitroglycerin .....	462
2-Methyl-4-nitroaniline .....	462, 777	Microscopy.....	863	2-Mononitroglycerin .....	462
2-Methyl-5-nitroaniline .....	462, 490	Migration in olive oil .....	179	Mono-n-octyl phthalate (ring-1,2-13C2, dicarboxyl-13C2,99%) .....	665
2-Methyl-3-nitroanisole .....	348	Mild acid butter .....	142	Mono-n-octyl phthalate .....	665
3-Methyl-4-nitroanisole .....	348	Military Fuel JP-5.....	436, 488	Monooctyltin trichloride .....	502
2-Methyl-1-nitronaphthalene .....	490	Milk powder.....	139	Mono-n-pentyl phthalate .....	665
18-Methylnonadecanoic acid .....	296	Milk .....	135, 136, 138, 139, 141	Monosultap .....	350
18-Methylnonadecanoic acid methyl ester .....	296	Milk - Aflatoxin M1 .....	136, 308	Monuron.....	350
8-Methylnonanoic acid.....	296	Milk - PCBs .....	136	Monuron TCA .....	350
8-Methylnonanoic acid methyl ester .....	296	Milk - PCDDs and PCDFs .....	136	MOPSO .....	864
2-Methyloctadecane .....	490	Milk powder - Proximates .....	139	Morantel tartrate .....	443
16-Methyloctadecanoic acid .....	296	Milk powder - Trace elements .....	136	5-(4-Morpholinylmethyl)-3-amino-2-oxazolidinone.....	443, 664
16-Methyloctadecanoic acid methyl ester	296	Milk - Radioactive isotopes.....	137	Motor Oil .....	436
6-Methyloctanoic acid methyl ester .....	296	Milk - Trace elements .....	135	Moxidectin.....	443
Methyl paraben (ring-13C6,99%).....	661	Miloxacin-d3.....	443	MSTFA.....	238, 508
Methyl paraben .....	661	Mineral oil - PCBs (high level).....	228	MTBSTFA.....	509
Methyl pentachlorophenylsulfide .....	348	Mineral Spirits (25% weathered).....	437	Muic acid.....	285
3-Methylpentadecane .....	490	Mineral Spirits (50% weathered).....	437	Multi-test verification materials 233, 234, 877, 878	
14-Methylpentadecanoic acid .....	296	Mineral Spirits (75% weathered).....	437	Muscalur .....	350
14-Methylpentadecanoic acid methyl ester .....	296	Mineral Spirits (unweathered).....	437	Mushrooms - Trace elements.....	175
2-Methylpentane .....	490	MIR604 Maize .....	168	Mussel tissue .....	148
3-Methylpentane .....	490	Mirex (13C10,99%).. ..	349, 670, 683, 684, 690	Mussel tissue - Butyltin .....	148
4-Methylpentanoic acid .....	296	Mirex (13C8,99%).....	349, 685, 690	Mussel tissue - Domoic acid.....	151
4-Methyl-2-pentanone .....	490	Mirex .....	349, 670, 683, 685, 690	Mussel tissue - Okadaic acid.....	151, 310
4-Methyl-2-pentanone (MIBK).....	490	Modified JIS PCB Syringe Spike (13C12, 99%) .....	614	Mussel tissue - Organics .....	150
2-(4-Methylphenyl) propane (D14,98%)... ..	678	Molecular weight polymer standards .....	828, 871, 872, 873, 874	Mussel tissue (frozen) - PAHs, PCBs, Pesticides .....	149
3-Methylphosphinicopropionic acid.....	349	Molinat .....	350	Mussel tissue - PCBs .....	148
Methylphosphonic acid (13C,99%, methyl-D3,98%) .....	490, 685, 701	Molybdenum .....	516, 522, 525, 528	Mussel tissue - Saxitoxin .....	151
Methylphosphonic acid (methyl-D3,98%)	349, 490, 685, 690, 701	Molybdenum oxide, 99.99% .....	821	Mussel tissue - Trace elements.....	148
Methylphosphonic acid .....	349, 490, 701	MON 863 x MON 810 Maize .....	168	Myclobutanil .....	350
6alpha-Methylprednisolone.....	443	Monalide .....	350	Mycophenolic acid (13C17) .....	305
Methyl iso-propyl ketone.....	489	Monensin sodium salt hydrate.....	443		
Methyl propyl ketone.....	490	Mono-(5-carboxy-2-ethylpentyl) phthalate	665		
Methyl sulfone PCBs .....	636	Mono[(3-carboxymethyl)hexyl]phthalate ..	665, 670		
Methyl-tert-butylether HPLC Optigrade®.	912				

## Product index

Mycophenolic acid .....	305	Nepheline syenite .....	264	4-Nitrophenyl-alpha-L-fucopyranoside .....	285
Myristoleic acid .....	296	Nequinat .....	444	4-Nitrophenyl-beta-L-fucopyranoside .....	285
Myristoleic acid methyl ester .....	296	Nervonic acid .....	296	2-Nitrophenyl-beta-D-galactopyranoside .....	286

2,3',4,5'-Tetrachlorobiphenyl..... 389, 602	Tetrachloroethylene (1,2-13C2,99%)..... 681	Thiabendazole (ring-13C6,99%).... 361, 446, 663
2,3,4,6-Tetrachlorobiphenyl ..... 389, 602	3,4,5,6-Tetrachloroguaiacol ..... 681	Thiabendazole ..... 302, 360, 446, 663, 762
2,3',4,6-Tetrachlorobiphenyl ..... 389, 602	Tetrachloroguaiacol ..... 495	Thiacloprid ..... 361
2,3,4,6-Tetrachlorobiphenyl ..... 389, 602	2,4,5,6-Tetrachloro-m-xylene... 496, 776, 794	Thiacloprid-amide ..... 361
2,3',4',6-Tetrachlorobiphenyl..... 389, 602	1,2,3,4-Tetrachloronaphthalene (13C10,99%)	Thiamethoxam ..... 361
2,3',5,5'-Tetrachlorobiphenyl..... 389, 602	1,2,3,4-Tetrachloronaphthalene..... 406, 653	Thiamine hydrochloride ..... 446
2,3,5,6-Tetrachlorobiphenyl ..... 389, 602	1,2,5,6-Tetrachloronaphthalene..... 406, 653	Thidiazuron ..... 361
2,3',5',6-Tetrachlorobiphenyl..... 389, 602	1,3,5,7-Tetrachloronaphthalene (13C10,99%)	Thien carbazole-methyl ..... 361
2,4,4',5-Tetrachlorobiphenyl ... 389, 390, 598, 602	1,3,5,7-Tetrachloronaphthalene..... 406, 653	Thifensulfuron-methyl ..... 361
2,4,4',6-Tetrachlorobiphenyl ..... 390, 602	2,3,6,7-Tetrachloronaphthalene..... 406, 654	Thiobencarb ..... 361
3,3',4,4'-Tetrachlorobiphenyl (13C12,99%)	2,3,4,5-Tetrachloronitrobenzene..... 360	Thiocyanate ..... 541
3,3',4,4'-Tetrachlorobiphenyl (D6,98%) .. 390, 596	2,3,4,5-Tetrachlorophenol..... 495, 681	Thiocyclam hydrogeneoxalate ..... 361
3,3',4,4'-Tetrachlorobiphenyl (D6,98%) .. 390, 596	2,3,4,6-Tetrachlorophenol..... 360, 495, 681	Thiodicarb ..... 361
3,3',4,4'-Tetrachlorobiphenyl.... 390, 598, 602	2,3,5,6-Tetrachlorophenol..... 360, 496, 681	Thiodiglycol (13C4,99%)..... 496, 701
3,3',4,5'-Tetrachlorobiphenyl (13C12,99%)	1,1,1,2-Tetrachloropropane ..... 496	Thiodiglycol (D8,98%)..... 496, 701
3,3',4,5'-Tetrachlorobiphenyl..... 390, 596	1,1,1,3-Tetrachloropropane ..... 496	Thiodiglycol ..... 496, 701
3,3',4,5-Tetrachlorobiphenyl .... 390, 598, 602	1,1,2,3-Tetrachloropropane ..... 496	Thiodiglycol sulfoxide..... 496, 701
3,3',4,5'-Tetrachlorobiphenyl... 390, 598, 602, 603	2,2'',5,5'''-Tetrachloro-p,p-quaterphenyl . 405	Thiofanox ..... 361
3,3',5,5'-Tetrachlorobiphenyl (13C12,99%)	2,3,5,6-Tetrachloro-p-terphenyl ..... 405	Thiofanox-sulfoxide..... 361
3,3',5,5'-Tetrachlorobiphenyl.... 390, 598, 603	2,4,4',6-Tetrachloro-p-terphenyl ..... 405	Thiometon ..... 361
3,4,4',5-Tetrachlorobiphenyl (13C12,99%)	1,2,3,4-Tetrachlorotetrahydronaphthalene	Thionazin ..... 361
3,4,4',5-Tetrachlorobiphenyl .... 390, 598, 603	alpha, alpha, alpha, 4-Tetrachlorotoluene .. 496	Thionazin-d10 ..... 361
3,3',5,5'-Tetrachloro-4,4'-biphenyldiol ..... 405	alpha, alpha, 2,6-Tetrachlorotoluene ..... 496	Thiophanate-methyl ..... 361
2,3',4,4'-Tetrachlorobiphenylether ..... 671	2,4,5,6-Tetrachloro-m-xylene..... 496	Thiophene (as S) ..... 804
2',3',4',5'-Tetrachloro-3-biphenylol ..... 405	Tetrachlorovinphos ..... 360	Thiophene ..... 496
2',3',4',5'-Tetrachloro-4-biphenylol ..... 405	Tetraconazole ..... 360	Thiosulfate ..... 541
Tetrachlorobisphenol A (ring-13C12,99%)	n-Tetracontane ..... 435, 496	Thiosultap disodium ..... 361
640, 667, 671	n-Tetracosane (D50,98%) ..... 673	2-Thiouracil ..... 446
Tetrachlorobisphenol A..... 640, 667, 671	n-Tetracosane ..... 496	Thiram ..... 361
3,4,5,6-Tetrachlorocatechol ..... 681	Tetracosanoic acid ..... 297	Thorium..... 520, 526, 529
1,2,3,4-Tetrachlorodibenzo-p-dioxin (13C12,99%)	1-Tetracosanol ..... 297	DL-Threonine (Allo-Free)..... 291
1,2,3,4-Tetrachlorodibenzo-p-dioxin (13C6,99%)	Tetracycline hydrochloride ..... 446	L-Threonine ..... 291
1,2,3,4-Tetrachlorodibenzo-p-dioxin ..... 551	Tetradecachloro-m-terphenyl..... 405	Thulium ..... 520, 526
1,2,3,4-Tetrachlorodibenzo-p-dioxin 410, 551	n-Tetradecane ..... 496	L-Thyroxine (Thyrosine-ring-13C6,99%).. 662
1,2,3,9-Tetrachlorodibenzo-p-dioxin ..... 551	Tetradecanedioic acid..... 297	Tiamulin fumarate..... 447
1,2,6,7-Tetrachlorodibenzo-p-dioxin ..... 551	Tetradecanoic acid ..... 297	TIC (Total Inorganic Carbon)..... 508

# LGC Standards proficiency testing

LGC Standards is a major international provider of proficiency testing services. Operating from a dedicated site in the UK at Bury, Lancashire, the proficiency testing business encompasses over 6,000 participating laboratories in more than 130 countries across the world.

We offer an unprecedented breadth of schemes across a wide range of industries including: meat, dairy and other food sectors, water, soil and other environmental sectors, brewing, distilling, malting, sugar, forensic, consumer safety and pharmaceutical, most of which are run on an international basis.

Benefits of proficiency testing participation include:

- Monitor and improve quality of measurements
- Inter-laboratory measurement comparisons
- Greater process control
- Demonstrate competency to customers and accreditation bodies
- Staff development and training
- Evaluate methods and instrumentation

# Catalogues from LGC Standards

LGC Standards provides products and services to improve measurement and quality control within your laboratory.

## **Our extensive range of catalogues:**

- Analytical reference materials and standards for food, industrial and environmental applications
- ATCC cell biology catalogue
- ATCC microbiology catalogue
- ChromaDex phytochemical reference standards
- Clinical, forensic and sports drugs reference materials
- High purity solvents and acids
- Higher order reference materials
- Lipids catalogue
- Metals and related products - reference materials
- Pharmaceutical reference substances and impurities
- Proficiency testing schemes catalogue
- Reference materials for physical properties
- Tools for ADME/Tox: reagents, standards and model systems.
